
k22: Navigating around Linux

Alex Delis

ad -AT+ di.uoa.gr

Fall 2018

`www.di.uoa.gr/~ad/k22/index.html`

Section: Students with *Odd* Matriculation Number

Course Material

- ▶ Introduction to Unix
- ▶ Shell Programming
- ▶ Using system calls in C:
 - ▶ Error Handling
 - ▶ Dispatch/receipt of Signals
 - ▶ Creation, control and termination of processes and threads.
 - ▶ Basic IPC: pipes, queues, semaphores, shared memory segments.
 - ▶ Low level I/O Operations
 - ▶ Sockets

Operating System

- ◇: Software that goes-in-between user(s) + hardware
- ◇: Objective
 - ▶ Using a computing system without much hassle
 - ▶ Efficient use of the hardware
- ◇: Continual Resource Management
 - ▶ Central Processor Units (CPUs)
 - ▶ Short-term, volatile, main memory
 - ▶ Secondary or long term memory including disks, flash memories.
 - ▶ I/O devices including Network Interface Cards - NICs

UNIX OS

- ▶ Late sixties at Bell Laboratories (mostly written in assembly).
- ▶ Early seventies the system was re-written using C.
- ▶ Many changes since that time:
 1. Major revision by UC-Berkeley (in the 80s)
 2. Redevelopment for SPARCprocs by SUN Micro—*Solaris* (90s)
 3. Release of `LINUX` and ongoing development (90s, 00s and 10s)
- ▶ Unix/`LINUX` (in various versions and releases) are now used not only in servers but also in workstations, PCs, Tablets and devices.
- ▶ If you do not have it in your own machine, *get it now!*

How to Obtain LINUX/Unix?

There are 3 ways:

- ▶ *Virtualization*: from the OS of your choice install LINUX using a virtualization tool such as *Virtual Box* or *VM Player*.
- ▶ *Dual Boot*: chop a portion of your disk (possibly with gparted) and install LINUX on the second partition (while maintaining your initial installation).
- ▶ *The ad Way*: erase everything you have on your machine and install LINUX. Then, proceed to re-install any other OS you may want with LINUX using *Virtual Box* or *VM Player*.
- ▶ *Web Sources*:
 - *Virtual Box* and
 - *VM Player*.

Fundamental Characteristics of Unix

- ▶ Multiple Users Simultaneously
- ▶ Multi-tasking, concurrent processes, time-sharing
- ▶ Security mechanisms
- ▶ Networking support
- ▶ Monolithic structure:
 1. Kernel
 2. Shells (c, bash, bourne, korn, t, etc.)
 3. System Programs
- ▶ *System Calls* allow interaction with kernel services in terms of C functions.
- ▶ Scripting capabilities: one can "program" the shell.

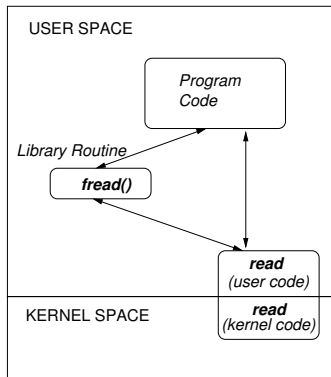

System Calls and Library Routines

- ▶ library call:

```
nread = fread(unputbuff, OBJSIZE, numberobjs, fileprt);
```

- ▶ low-level system call:

```
nread = read(filedes, inputbuf, BUFSIZE);
```

Unix File System (UFS) – Hierarchical Logical Structure

- ▶ Root directory (/)
- ▶ Current directory (/.)
- ▶ Parent directory (/..)
- ▶ Absolute and relative Paths
- ▶ Files and Links
- ▶ Devices

User Account

- ▶ User name (*userid*) and password (*pass*)
- ▶ Shell is available as soon as a user gets authorized
- ▶ User groups (*users, group, others*)
- ▶ (Initial) Working directory

```
ad@melbourne's password:
Linux melbourne 2.6.24-23-generic #1 SMP Mon Jan 26 00:13:11 UTC 2009 i686

The programs included with the Ubuntu system are free software; the exact
distribution terms for each program are described in the individual files
in /usr/share/doc/*/copyright.
Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by applicable
law.

```

Basic Commands in Unix

man	display manual page
ls	listing of the current dir
pwd	print working directory
cd	change current directory to
mkdir	create a new directory
rmdir	purge an existing directory
cp	copy a file/directory
mv	move a file/directory to
rm	remove a file/directory
cat	display content of a file
lpr	print out a file
vi	tty text editor

NAME

pwd - print name of current/working directory

SYNOPSIS

pwd [OPTION]...

DESCRIPTION

Print the full filename of the current working directory.

-L, --logical

use PWD from environment, even if it contains symlinks

-P, --physical

avoid all symlinks

--help display this help and exit

--version

output version information and exit

NOTE: your shell may have its own version of pwd, which usually super sedes the version described here. Please refer to your shell's documentation for details about the options it supports.

  4 -rw-r--r--  1 ad ad    1200 2010-02-15  22:48 bbbb
  4 -rw-r--r--  1 ad ad      15 2010-02-15  22:45 aaa
ad@ad-desktop:~/Set001/Samples$
```

File that is “interpreted” when the shell starts:

- ▶ bash \implies .bashrc/.profile
- ▶ csh \implies .cshrc
- ▶ tcsh \implies .tcshrc
- ▶

Access Rights

- ▶ Every file/catalog belongs to the user that has created it.
- ▶ Every user belongs to at least one group (*postgrads*, *undergrads*, *dep*, *users*, etc)
- ▶ Every file is named with at 10 characters
 - ▶ - `rWX r-X r-X`
user group others
 - ▶ 1st character is either "d" (directory) or "-" (file)
 - ▶ Three groups of characters — read/write/execute options

Permission Rules for files/directories

	File	Directory
r	Read or Copy a file	Read content in directory
w	Change or delete a file	Add or delete entries (files) in directory using commands
x	Run executable file	Reference or move to directory (without seeing names of other files)

Command “ls” (-d -R -t)

```
pubsrv1:/tmp>ls
hsperfdata_reserv  junk                output26675        sh5720
hsperfdata_root   mysql.sock         output26935

Text Editors for Creating ASCII Files

- ▶ `vi/vim <filename>`: edit the content of the file with name `<filename>`
 - ◇ Two modes of operations: *input* and *edit*
 - ◇ Move from input to edit with ESC button.
 - ◇ Move from edit to input mode by pressing "i"
- ▶ `www.yolinux.com/TUTORIALS/LinuxTutorialAdvanced_vi.html`
- ▶ `emacs`
- ▶ `pico`
- ▶ `ed` (ancient)
- ▶ `gedit`, `xemacs`, etc.

Commands for processing ASCII files

<code>chmod</code>	change access rights for files and catalogs
<code>more</code>	page-by-page display of file content
<code>less</code>	forward/backward display of a file content
<code>grep</code>	search for a specific symbol patterns in a file
<code>wc</code>	lexical statistics for files
<code>sort</code>	sort the lines of a text file
<code>ln</code>	created links
<code>cut</code>	display portion of lines from a file
<code>cmp</code>	compare two files
<code>diff</code>	display differences between two files
<code>head</code>	display top-k lines of a file
<code>tail</code>	display bottom-k lines of a file
<code>touch</code>	change the timestamp or create a file

Command: chmod

```

ad@ad-desktop:~/Set001/Samples$ wc -lw lista
 10  30 lista
ad@ad-desktop:~/Set001/Samples$
```

Command sort

```
ad@ad-desktop:~/Set001/Samples$ cat lista
john    32    london
eduardo 19    brazilia
jean    21    athens
marco   7     buenosaires
filip   23    telaviv
dennis  15    brisbane
louis   31    heraclion
dimi    34    heraclion
ji      27    washington
hyseyin 33    izmir
ad@ad-desktop:~/Set001/Samples$ sort lista
dennis  15    brisbane
dimi    34    heraclion
eduardo 19    brazilia
filip   23    telaviv
hyseyin 33    izmir
jean    21    athens
ji      27    washington
john    32    london
louis   31    heraclion
marco   7     buenosaires
ad@ad-desktop:~/Set001/Samples$
ad@ad-desktop:~/Set001/Samples$
```

Using the Delimiters in sort

- ▶ When a field for sorting is needed: $+number_1 - number_2$
- ▶ $number_1$: specifies the number of fields to be skipped to get to the beginning of the sort field.
- ▶ $number_2$: specifies the number of fields to be skipped, relative to the beginning of the line, to get to the end of the sort key.

Delimiter Examples

```
ad@ad-desktop:~/Set001/Samples$ sort +0 -1 lista
dennis 15 brisbane
dimi 34 heraclion
eduardo 19 brazilia
filip 23 telaviv
hyseyin 33 izmir
jean 21 athens
ji 27 washington
john 32 london
louis 31 heraclion
marco 7 buenosaires
ad@ad-desktop:~/Set001/Samples$ sort -r -u +2 -3 lista
ji 27 washington
filip 23 telaviv
john 32 london
hyseyin 33 izmir
louis 31 heraclion
marco 7 buenosaires
dennis 15 brisbane
eduardo 19 brazilia
jean 21 athens
ad@ad-desktop:~/Set001/Samples$ sort -r +2 -3 lista
ji 27 washington
filip 23 telaviv
john 32 london
hyseyin 33 izmir
louis 31 heraclion
dimi 34 heraclion
marco 7 buenosaires
dennis 15 brisbane
eduardo 19 brazilia
jean 21 athens
```

```
ad@ad-desktop:~/Set001/Samples$ sort -r -n +1 -2 lista
dimi      34  heraclion
hyseyin   33  izmir
john      32  london
louis     31  heraclion
ji        27  washington
filip     23  telaviv
jean      21  athens
eduardo   19  brazilia
dennis    15  brisbane
marco     7   buenosaires
ad@ad-desktop:~/Set001/Samples$
ad@ad-desktop:~/Set001/Samples$ sort -u +1 -4 lista
dennis    15  brisbane

```

Comparison between soft/hard links

Hard Links	Soft Links
"Pointer" to the initial file	Copy of the path to the initial file
Does not apply to directories	Applies to directories
Name change of the initial file does not create any problems	Name change in the initial file creates problems
Content changes in initial file are reflected in the link as well	Content changes in initial file are reflected in the link as well
File gets purged when <i>all</i> links are deleted	Deletion of initial file affects the link (point to non-existing file)

Command cut: -f: designates column selection, -d designates delimiter

```
ad@sydney:~/Set001/Samples$ cat lista1

scheduler is running
system default destination: hp-LaserJet-1320-series
device for hp-LaserJet-1320-series: usb://HP/LaserJet%201320%20series
hp-LaserJet-1320-series accepting requests since Fri 19 Feb 2010 01:03:52 PM EET
printer hp-LaserJet-1320-series is idle.  enabled since Fri 19 Feb 2010 01:03:52
PM EET
Printer is now online.
ad@ad-desktop:~/Set001/Samples$
```

Shells (csh, tcsh, bash, kornsh, etc.)

- ▶ Once “connected” to a tty in LINUX you are provided with a default bash shell.
- ▶ `logout` severs the authenticated session the user maintains.
- ▶ `exit` or `control-d` disconnect terminates the shell session.
- ▶ You can go to csh or tcsh by simply typing `tcsh` or `csh`.
- ▶ Once a shell is initiated, the file `~/.cshrc` is executed.
- ▶ As soon as a user logs into a system, the commands in file `.login` are executed.
- ▶ Once a user logouts from the system the shell commands in file `.logout` are executed.

Shell (input/output)

Every shell has three predefined I/O means of communicating with the user:

- ▶ *stdin*: standard input (often the keyboard)
- ▶ *stdout*: standard output (often the screen)
- ▶ *stderr*: standard error (often the screen)
- ▶ file descriptors for the above files are 0, 1, 2 respectively.

For a number of system programs including `cat`, `lpr`, `grep`, `wc`, `sort`, `head`, `tail` etc., the file parameters are optional:

```
ad@ad-desktop:~/Set001/Samples$ wc
this is a test - this is only
a test, this is a test
this is only a test
this is a
test
only
bye
{control-d}
      7      25      100
ad@ad-desktop:~/Set001/Samples$
```

csH redirection

- Redirection of the *stdin*:

```
ad@ad-desktop:~/Set001$  
ad@ad-desktop:~/Set001$ csh  
%  
%  
% grep clio lista  
louis 31 heracliion  
dimi 34 heracliion  
% grep clio < lista  
louis 31 heracliion  
dimi 34 heracliion  
% grep bra < lista > out1  
% cat out1  
eduardo 19 brazilia
```

csH redirection

- Redirection of the stdout and stderr (>, >!)

```
% date > filea
% cat < filea
Fri Feb 19 17:59:46 EET 2010
% ls -la > filea
filea: File exists.
% echo A test line > filea
filea: File exists.
% echo This is a test >! filea
% more filea
This is a test
%
```

- You get the above results when the noclobber variable is set
- in csH ‘set noclobber=on’

Append type redirection

```
% cat a_file
Fri Feb 19 17:38:24 EET 2010
% cat b_file
cat: b_file: No such file or directory
% date >> c_file
% cat c_file
Fri Feb 19 20:54:59 EET 2010
% cat c_file >> a_file
% cat a_file
Fri Feb 19 17:38:24 EET 2010
Fri Feb 19 20:54:59 EET 2010
%
```

Redirecting inout-redirect

```
#include <stdio.h>
#include <unistd.h>

main(){
int i=0;
while(1) {
    for( i=0; i<3; i++){
        fprintf(stdout,"Guillermo "); // high-level I/O interface
        write(1,"Guillermo ",10); // I/O with file descriptor
        fflush(stdout); // I/O with file pointer
    }
    fprintf(stdout,"!\n");
    write(2,"U r a smart fella\n",20); // low-level I/O with fd
    sleep(1);
}
}
```

The *stdout/stderr* of the execution appear as:

```
ad@haiku:~/Set001/src$ ./inout-redirect
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
U r a smart fella
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
U r a smart fella
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
U r a smart fella
.....
```

Directing stdout and stderr to specific files

- send stdout to file out.log

```
ad@haiku:~/Set001/src$ ./inout-redir 1> out.log
U r a smart fella
U r a smart fella
U r a smart fella
^C
ad@haiku:~/Set001/src$ cat out.log
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo
ad@haiku:~/Set001/src$
```

- send stdout to out.log and stderr to err.log

```
ad@haiku:~/Set001/src$ ./inout-redir 1> out.log 2> err.log
^C
ad@haiku:~/Set001/src$ cat out.log
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo
ad@haiku:~/Set001/src$ cat err.log
U r a smart fella
U r a smart fella
U r a smart fella
ad@haiku:~/Set001/src$
```

Some More Redirection

- Ways to send output/error to a single file:

```
ad@haiku:~/Set001/src$ ./inout-redir >& allout
^C
ad@haiku:~/Set001/src$ cat allout
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
ad@haiku:~/Set001/src$ ./inout-redir &> allout
^C
ad@haiku:~/Set001/src$ cat allout
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
ad@haiku:~/Set001/src$
```

- And another command flavor...

```
ad@haiku:~/Set001/src$ ./inout-redir > allout 2>&1
^C
ad@haiku:~/Set001/src$ cat allout
Guillermo Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
Guillermo !
Guillermo Guillermo Guillermo Guillermo Guillermo U r a smart fella
ad@haiku:~/Set001/src$
```

```

Metacharacters

- * : matches any number (zero or more) of characters
- ? : matches one exactly character
- $[c_1 c_2 c_3 \dots c_n]$: matches exactly one character from set:
 $\{c_1 c_2 c_3 \dots c_n\}$
- $[c_1 - c_n]$: matches exactly one character from those in the range $c_1 - c_n$

Metacharacter-Examples with ls

```
ad@sydney:~/Set001/Samples$ ls -dF ???
aaa sss/ sts/ usr/ uuu/ zzz
ad@sydney:~/Set001/Samples$ ls *z*
all-lists.zip  mylists.zip  mylist.tar.gz  mylist.zip  zzz

Variables

- ▶ **Predefined Variables:**
 - ▶ *Shell Variables:* used to configure shell (ie, setting the internal field separator which is often a space or tab).
 - ▶ *Environment Variables:* used to configure the environment (ie, a system variable determines which editor to edit the history file).
- ▶ *User defined Variables:* created by the users for storing values; may start with an alphabetic or `_` character.

setting & unsetting environment variables with csh

```
perth:/home/users/ad>printenv | head -6
USER=ad
HOME=/home/users/ad

InputFile      LinkedList.c  main.c      MyHeader.h      OrderedLinkedList.h
InputFile.out  LinkedList.h  Makefile    OrderedLinkedList.c
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$ gcc -c main.c
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$ gcc -c LinkedList.c
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$ gcc -c OrderedLinkedList.c
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$ gcc main.o LinkedList.o
OrderedLinkedList.o -o myexe
ad@ad-desktop:~/Set001/Sample-C/SampleGCC$ ./myexe
expected syntax: myexe inputfile
```

Using Makefile

- ▶ An easy way to organize separate compilation of programs and activities
- ▶ The basic format of Makefile command is:
target: required-files
TAB → *command*
- ▶ The existence of TAB before the command above is **imperative**; otherwise, makefile does not work! (strange but that is the way it goes).
- ▶ The *required-files* have to be “done” before the *target* is realized.
- ▶ If *required-files* have not “changed” then the command of the Makefile does not get executed (things are up to date).
- ▶ Often, the final target of a Makefile is termed *all*.
- ▶ There is also a target named *clean* that purges all *.o and executable files.

Makefile

```
# In order to execute this "Makefile" just type "make" -A. Delis (ad@di.uoa.gr)
OBJS      = main.o LinkedList.o OrderedLinkedList.o
SOURCE    = main.c LinkedList.c OrderedLinkedList.c
HEADER    = MyHeader.h LinkedList.h OrderedLinkedList.h
OUT       = myexe
CC        = gcc
FLAGS    = -g -c
# -g for debugging mode ; -c for objects file creation

$(OUT): $(OBJS)
        $(CC) -g $(OBJS) -o $@

# create/compile the individual files >>separately<<
main.o: main.c
        $(CC) $(FLAGS) main.c

LinkedList.o: LinkedList.c
        $(CC) $(FLAGS) LinkedList.c

OrderedLinkedList.o: OrderedLinkedList.c
        $(CC) $(FLAGS) OrderedLinkedList.c

# clean house
clean:
        rm -f $(OBJS) $(OUT)

# do a bit of accounting
count:
        wc $(SOURCE) $(HEADER)
```

```
OBJS = main.o iodat.o dorun.o
LIB = /usr/lib/crtn.o
CC = /usr/bin/gcc

program: ${OBJ} ${LIB} mylibops.a
        ${CC} -o $@ ${OBJ} ${LIB} mylibops.a

main.o: main.c
        ${CC} -c $?

iodat.o: iodat.c
        ${CC} -c $?

dorun.o: dorun.c
        ${CC} -c $?

mylibops.a: interact.o sched.o gen.o
        ar r $@ $?

interact.o: interact.c
        ${CC} -c $?

gen.o: gen.c
        ${CC} -c $?

sched.o: sched.c
        ${CC} -c $?
```

- ▶ `$?` : current list of prerequisites
- ▶ `$@` : current target
