SHACL

Shapes Constraint Language

Dr Eleni Tsalapati

Marie Curie Fellow

Why SHACL

- Ontologies & KGs have gained attention also in more “closed” domains than Semantic Web
 - Manufacturing
 - Enterprises
 - Banking sector
 - etc

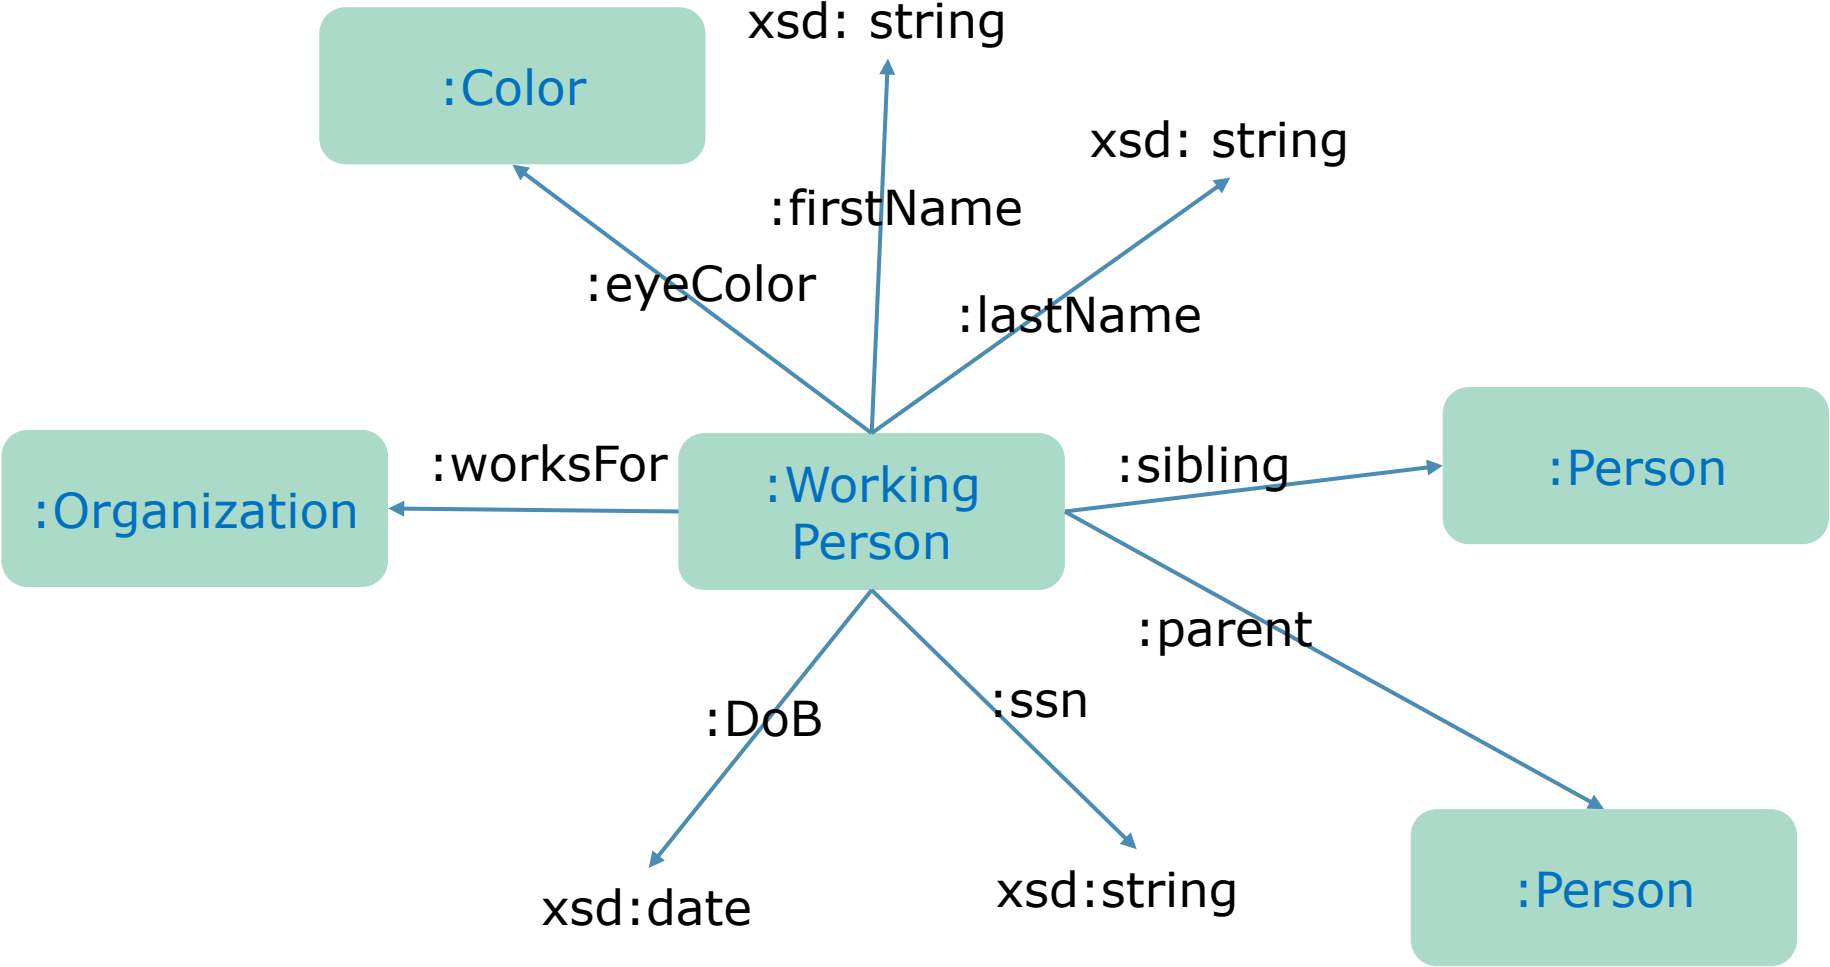

Why SHACL

- For these cases OWA is not always a good idea:
 - Manufacturing:
 - e.g., the deployment of a system
 - must be ensured that nothing is left out
 - Banking & Enterprise:
 - Different clients have different rights & benefits
- These worlds must be “closed”
- We need something more restrictive

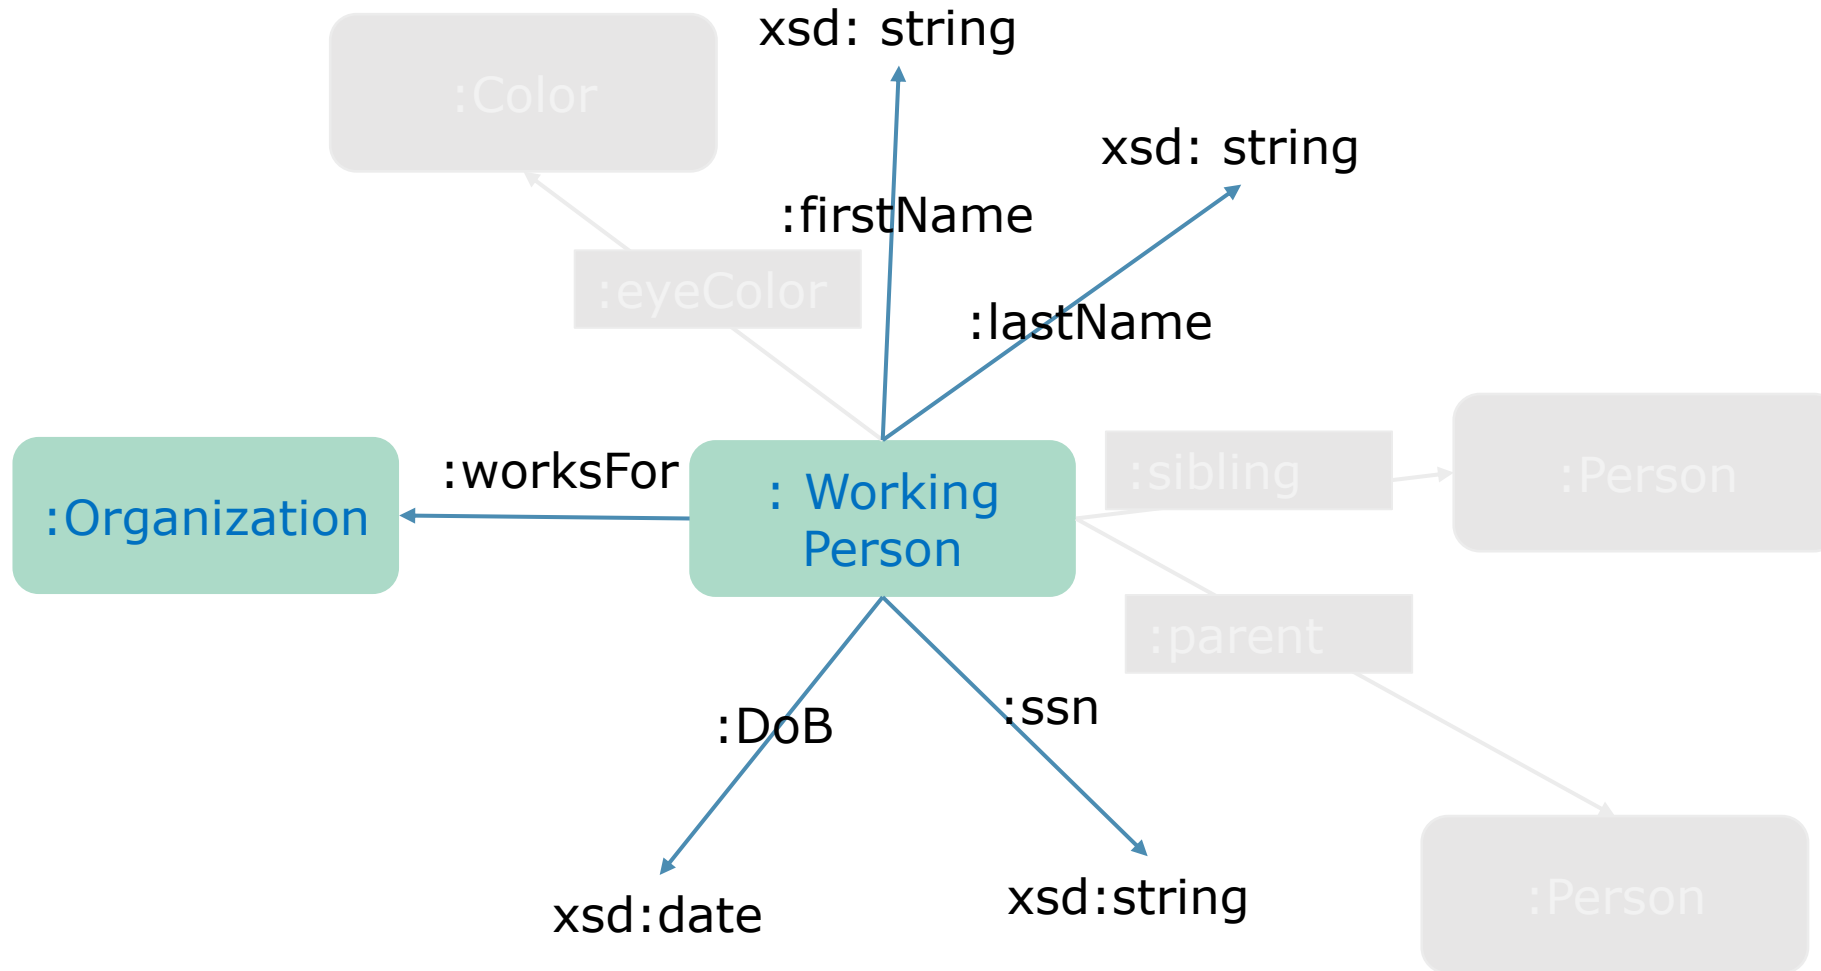

SHACL-Shapes Constraint Language

- An RDF-based language for **describing** and **validating** RDF graphs
- **Standardized** as a W3C Recommendation in July 2017
- Enables the ontology **reuse** through different **shapes** over the data

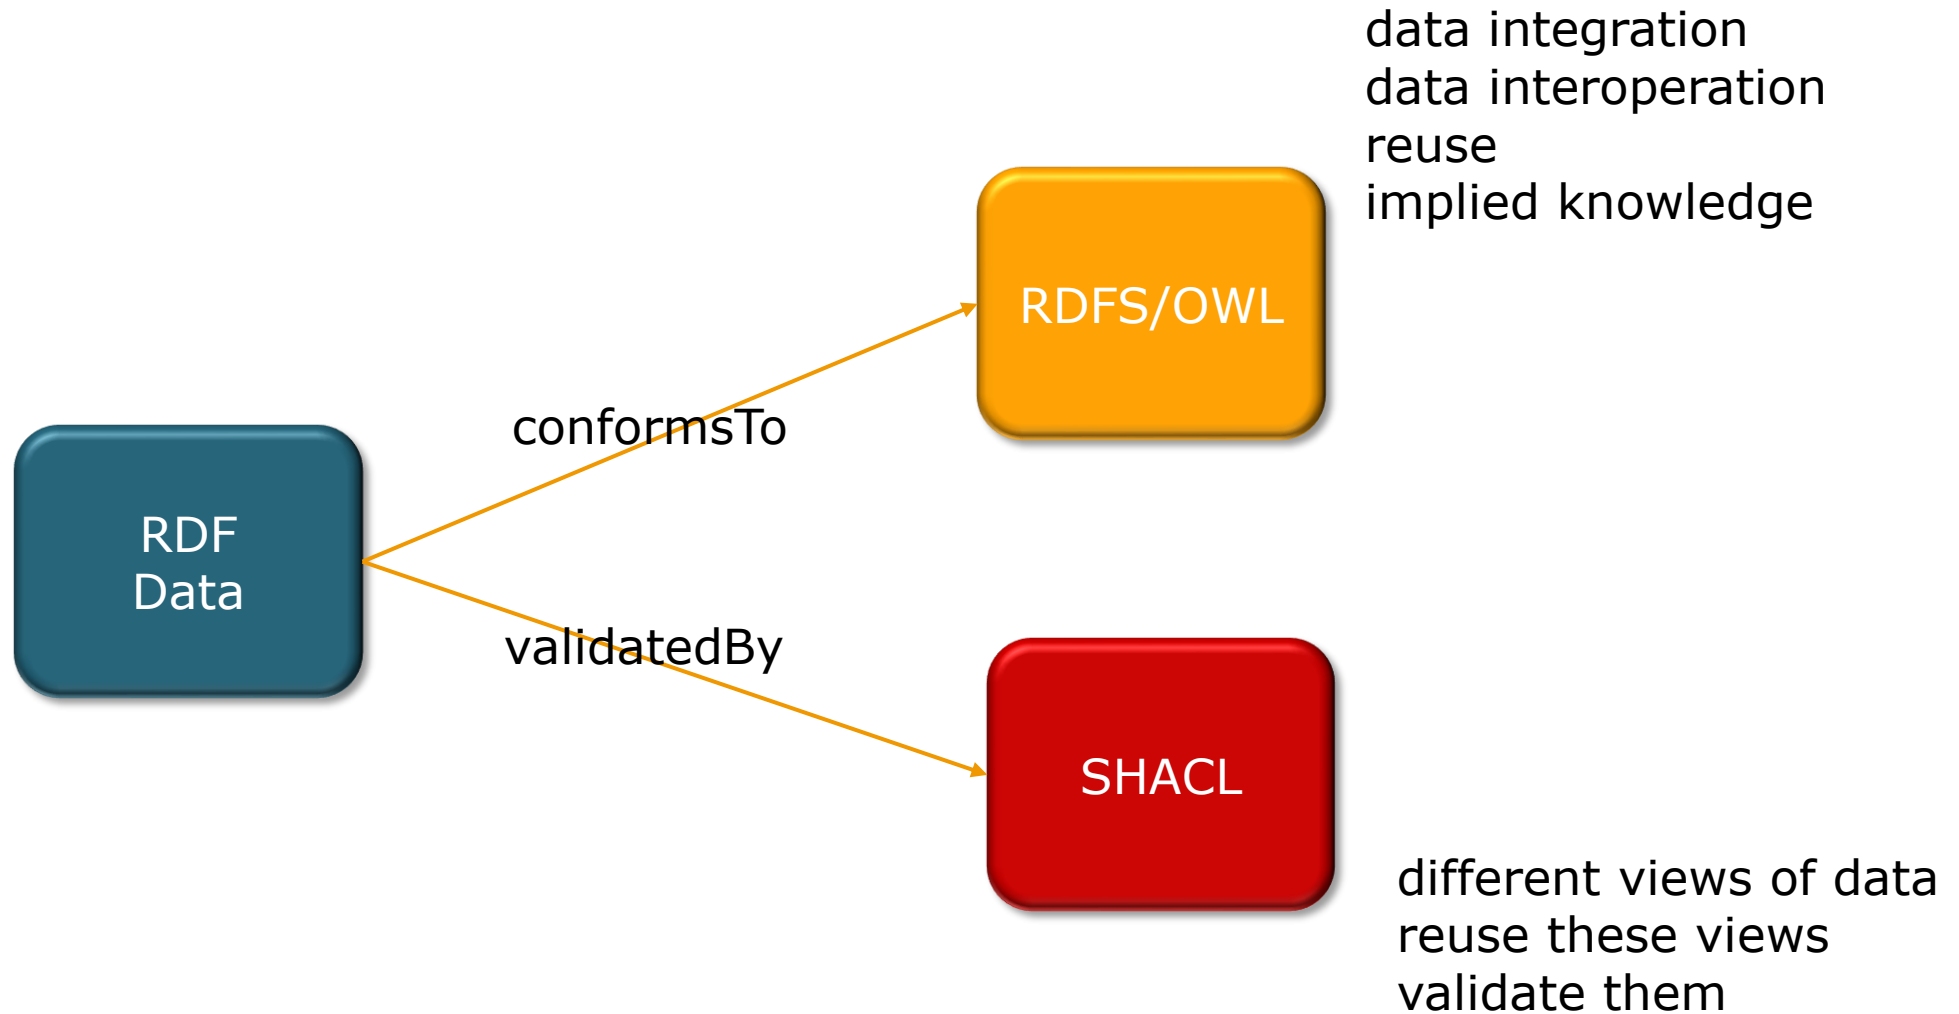

SHACL – Ontology Reuse

SHACL – Ontology Reuse

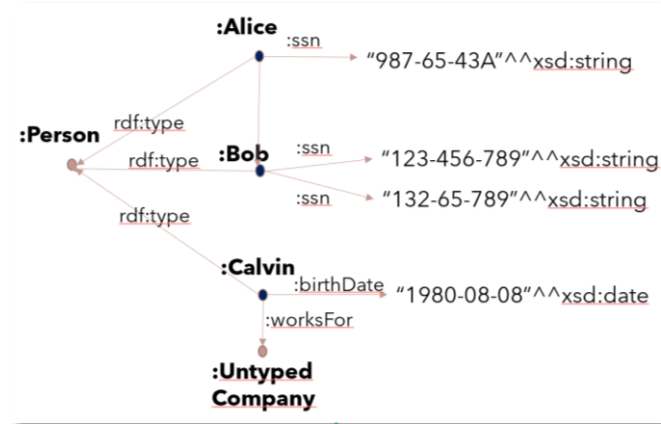

KG – OWL -SHACL

SHACL Processing

KG

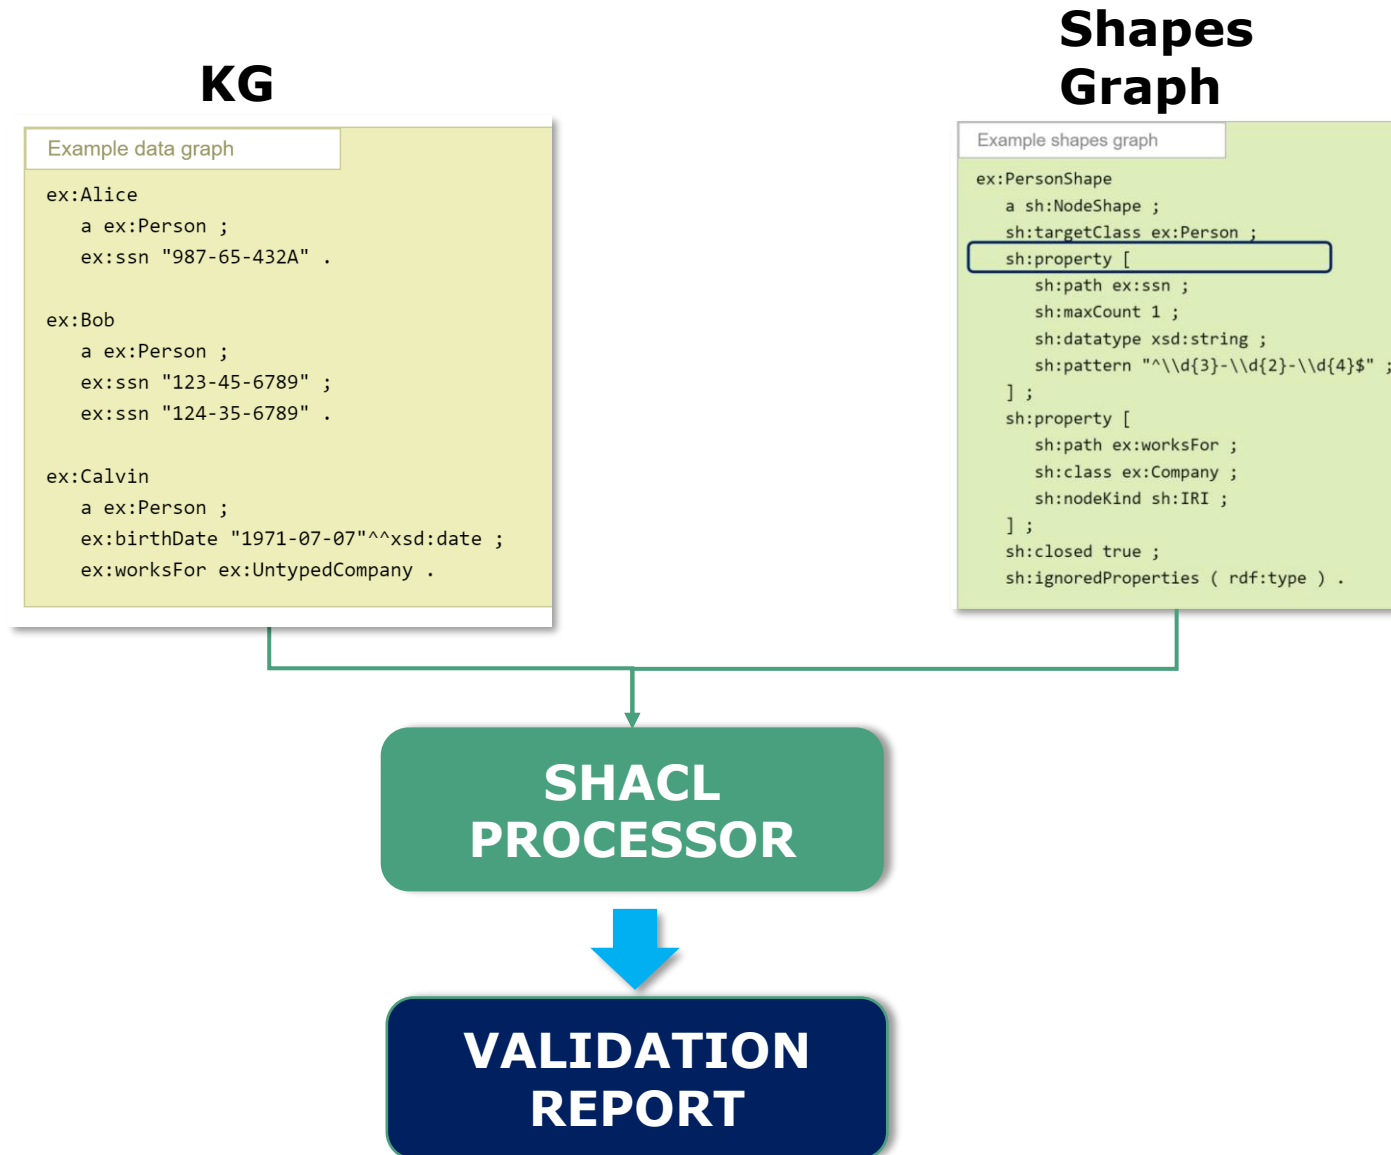

Shapes Graph

```
Example shapes graph
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

**SHACL
PROCESSOR**

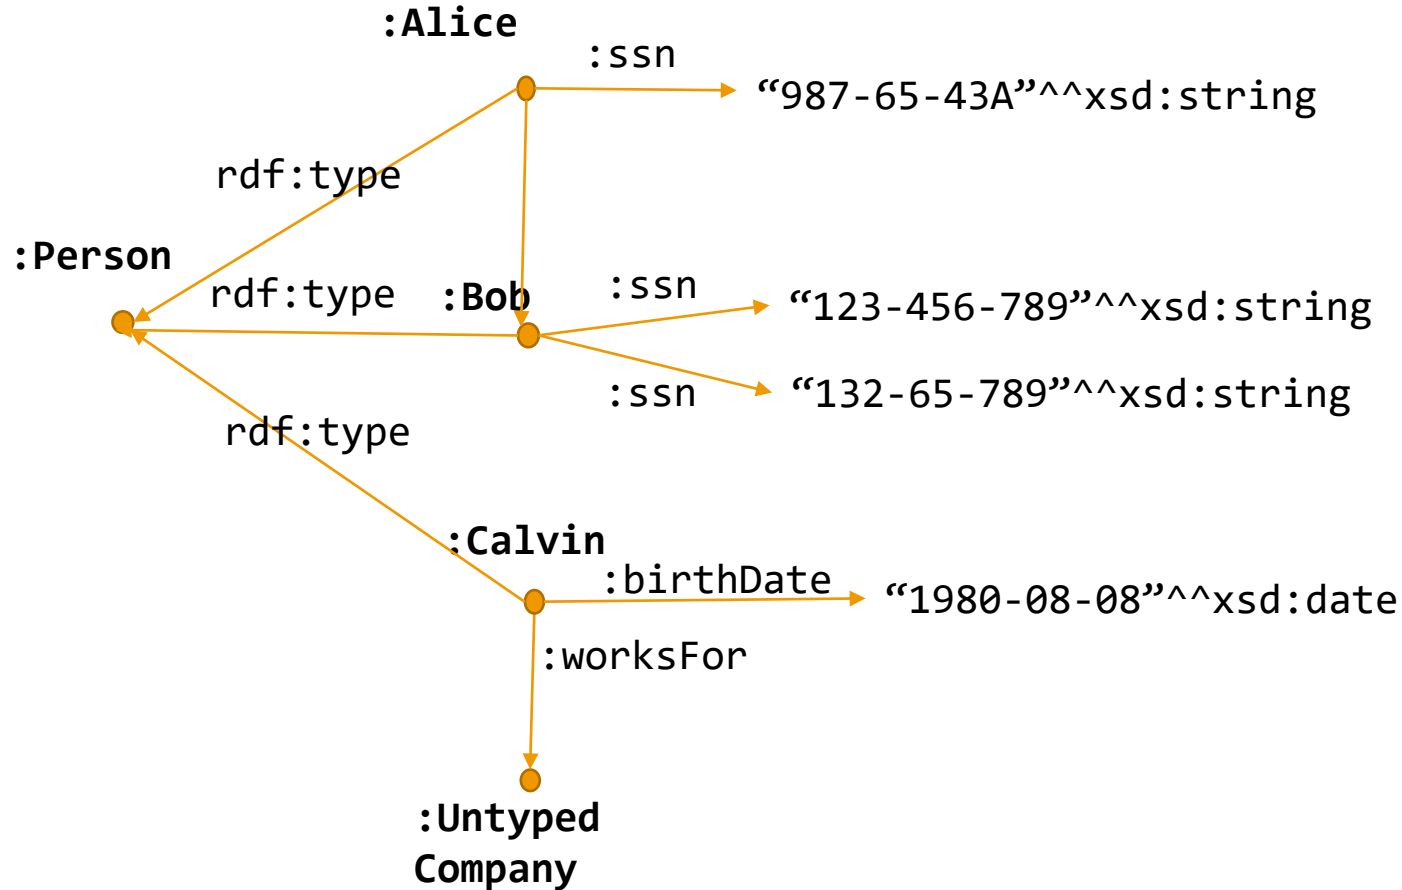

**VALIDATION
REPORT**

SHACL Processing

Example

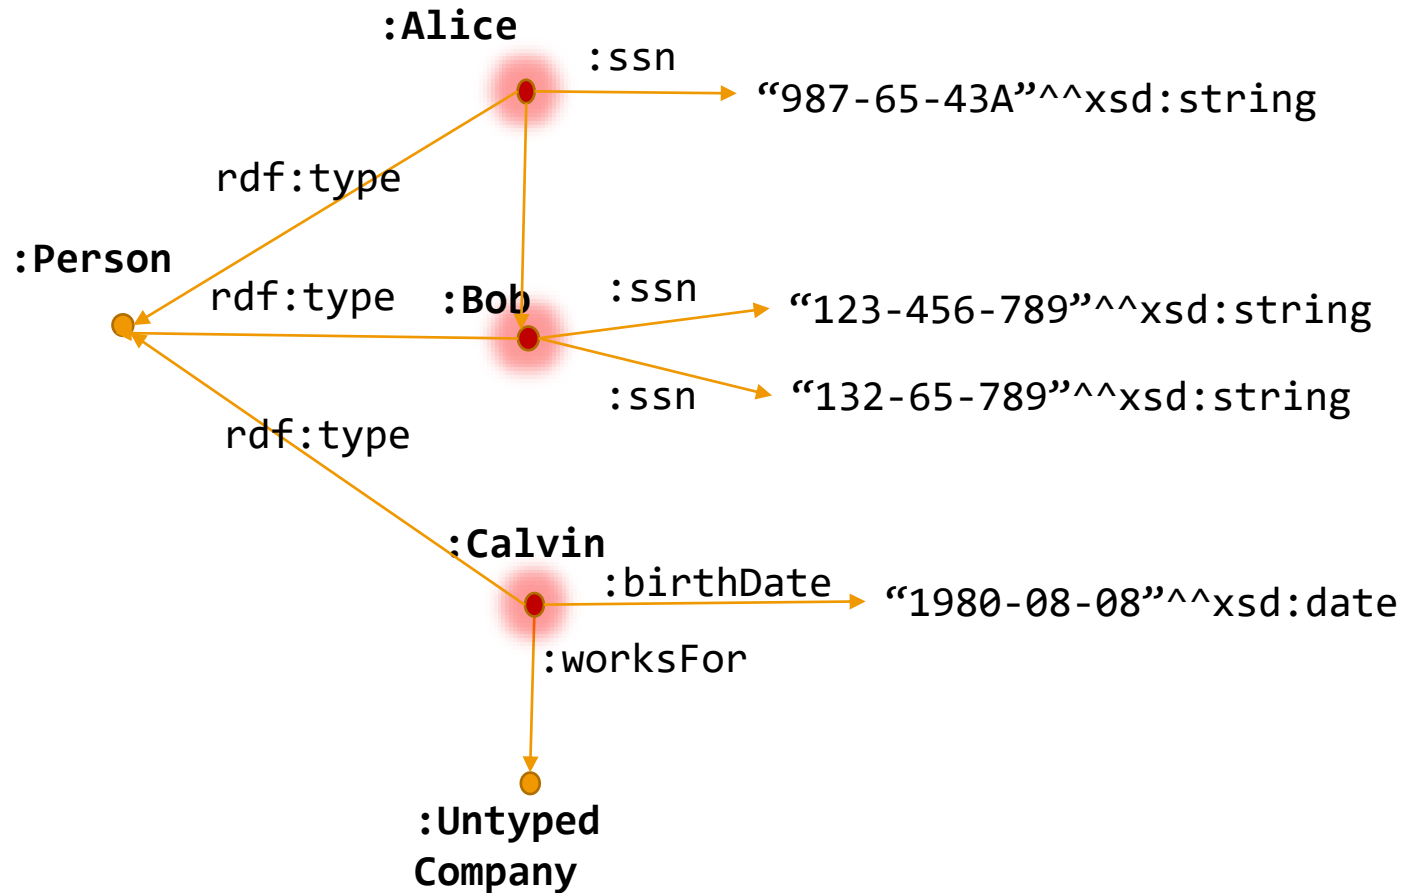

- **Shapes graph:** an RDF graph that contains shapes

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

Example – Focus nodes

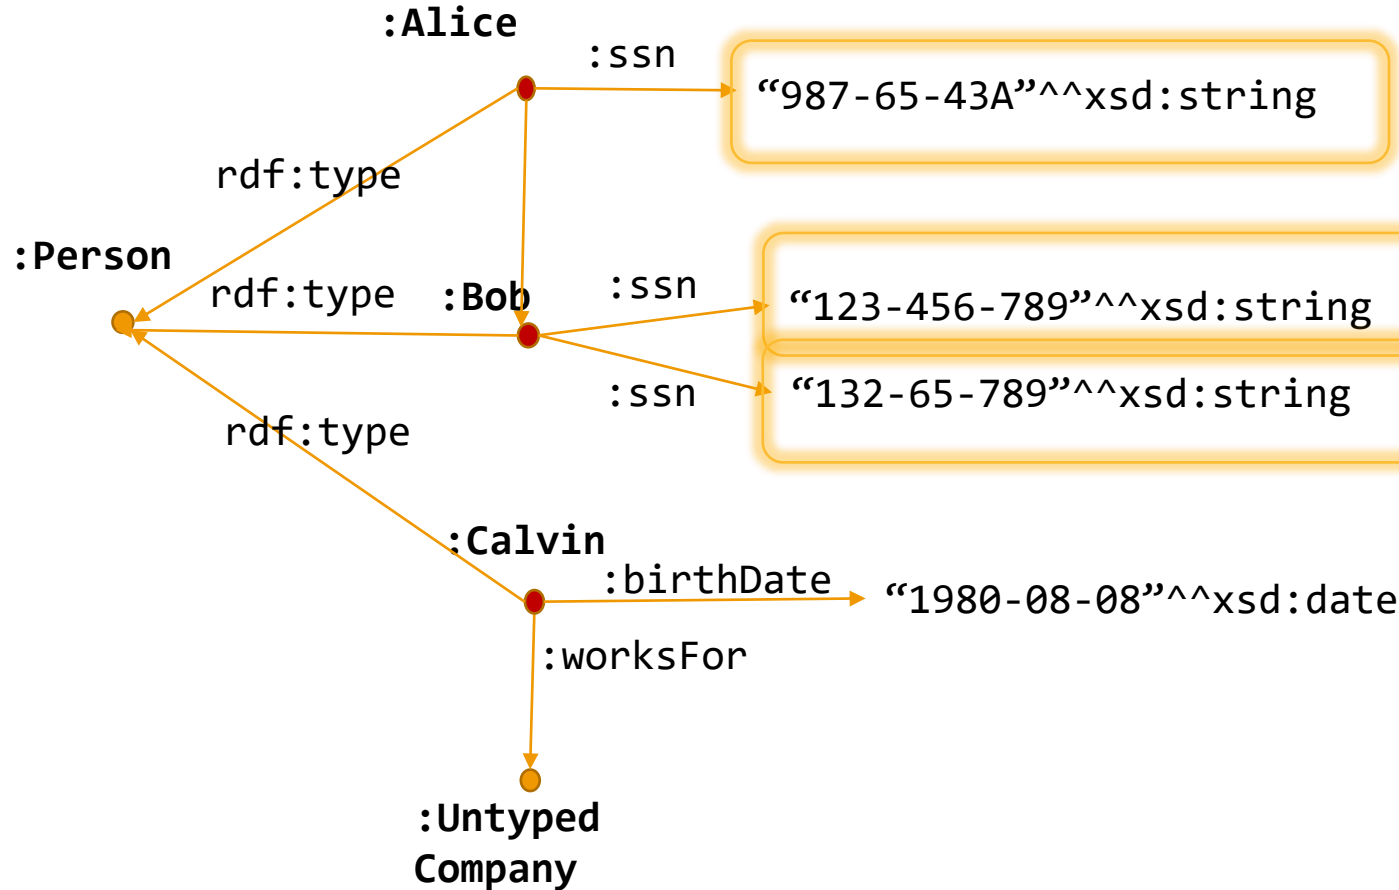

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\d{3}-\d{2}-\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

During the validation, the instances of the target class (ex:Person) become the **focus nodes** of the shape

Example – Focus nodes

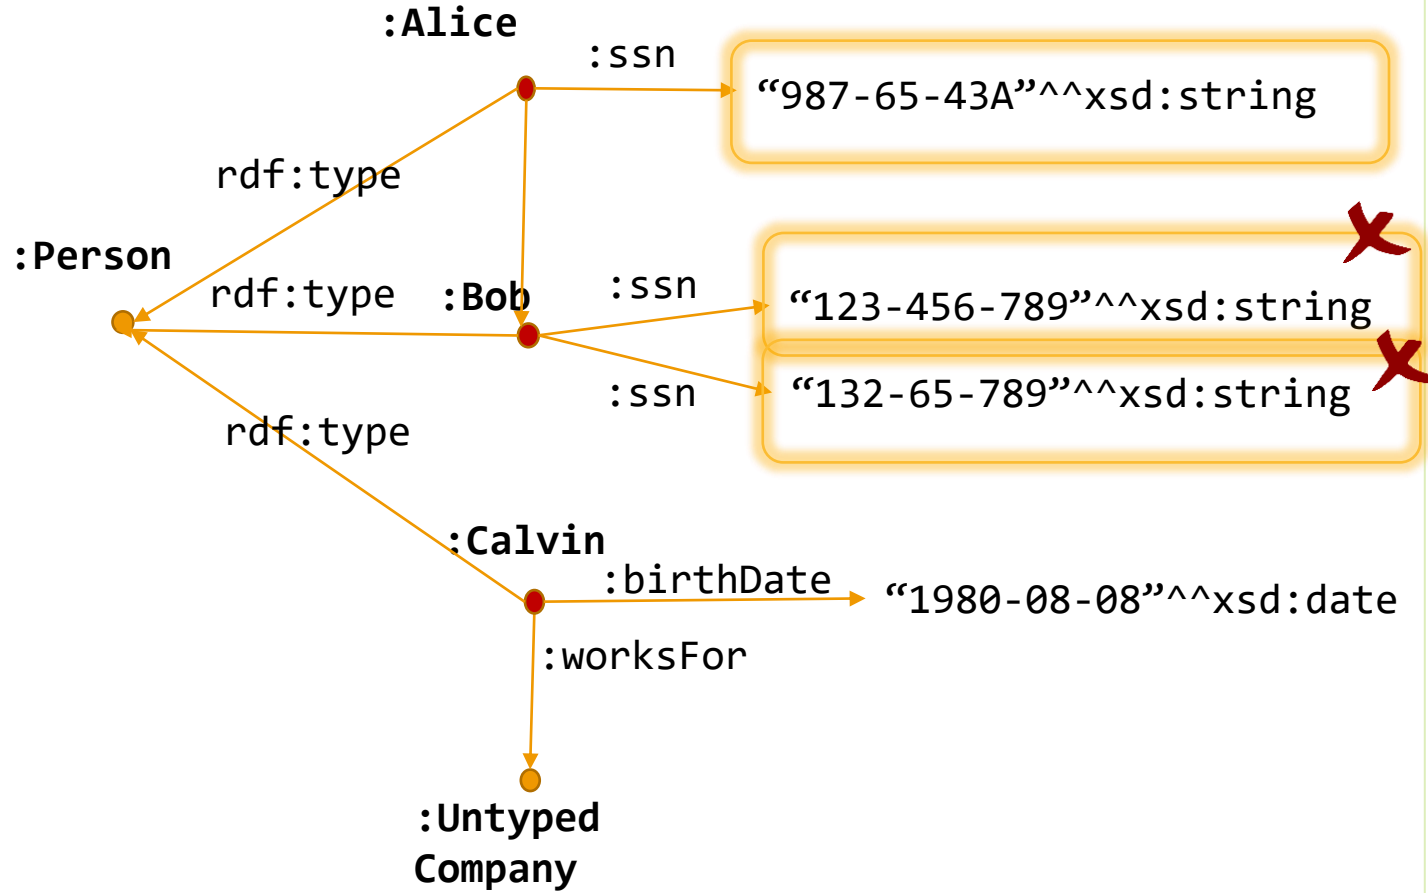

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\d{3}-\d{2}-\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

Property shape: constraints on the set of nodes that can be reached from the focus node through the sh:path value (i.e., the value nodes)

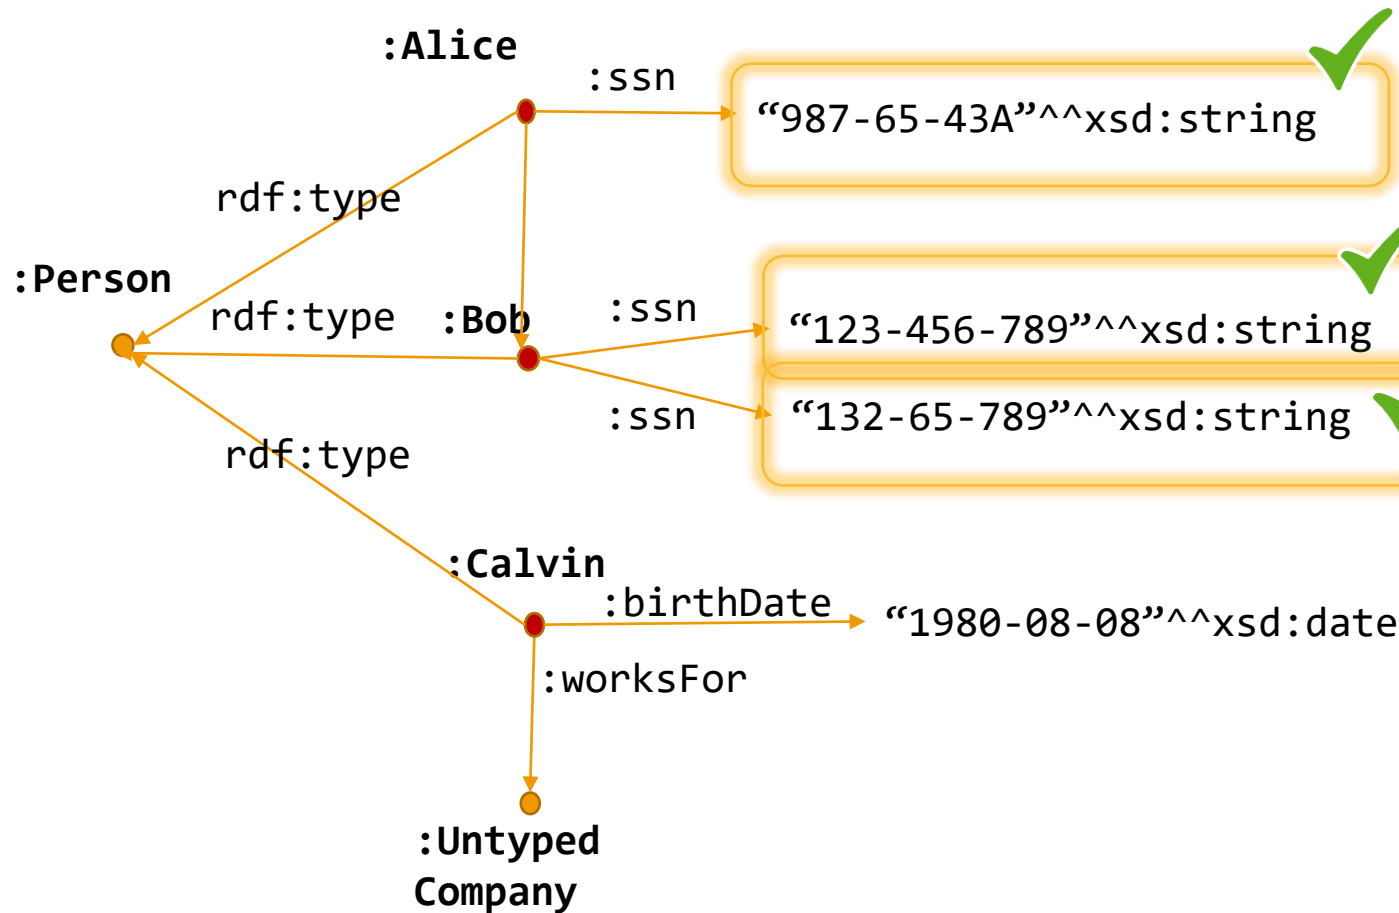

Example – Focus nodes

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

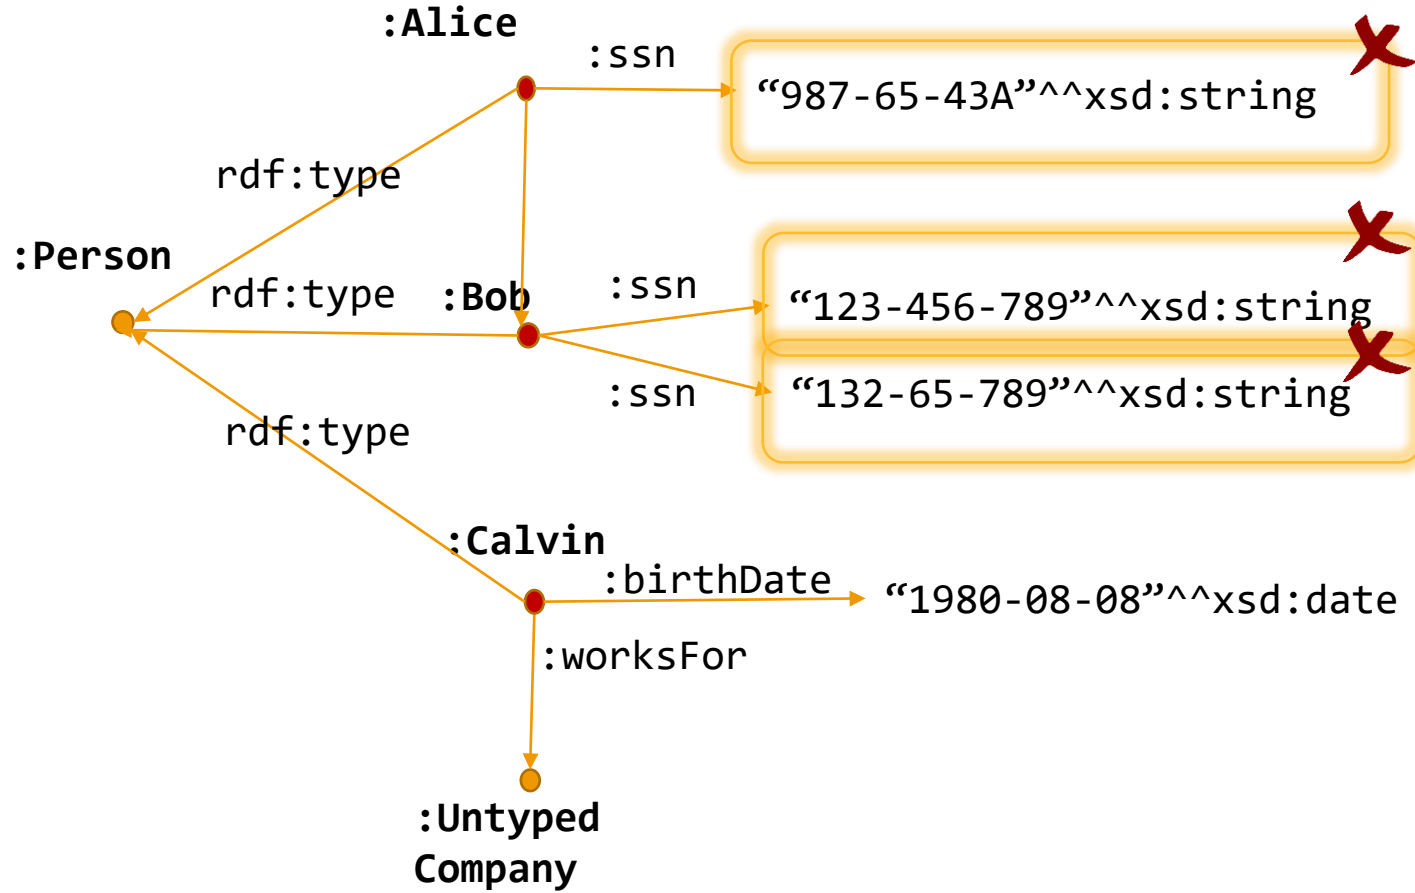

Example – Focus nodes

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

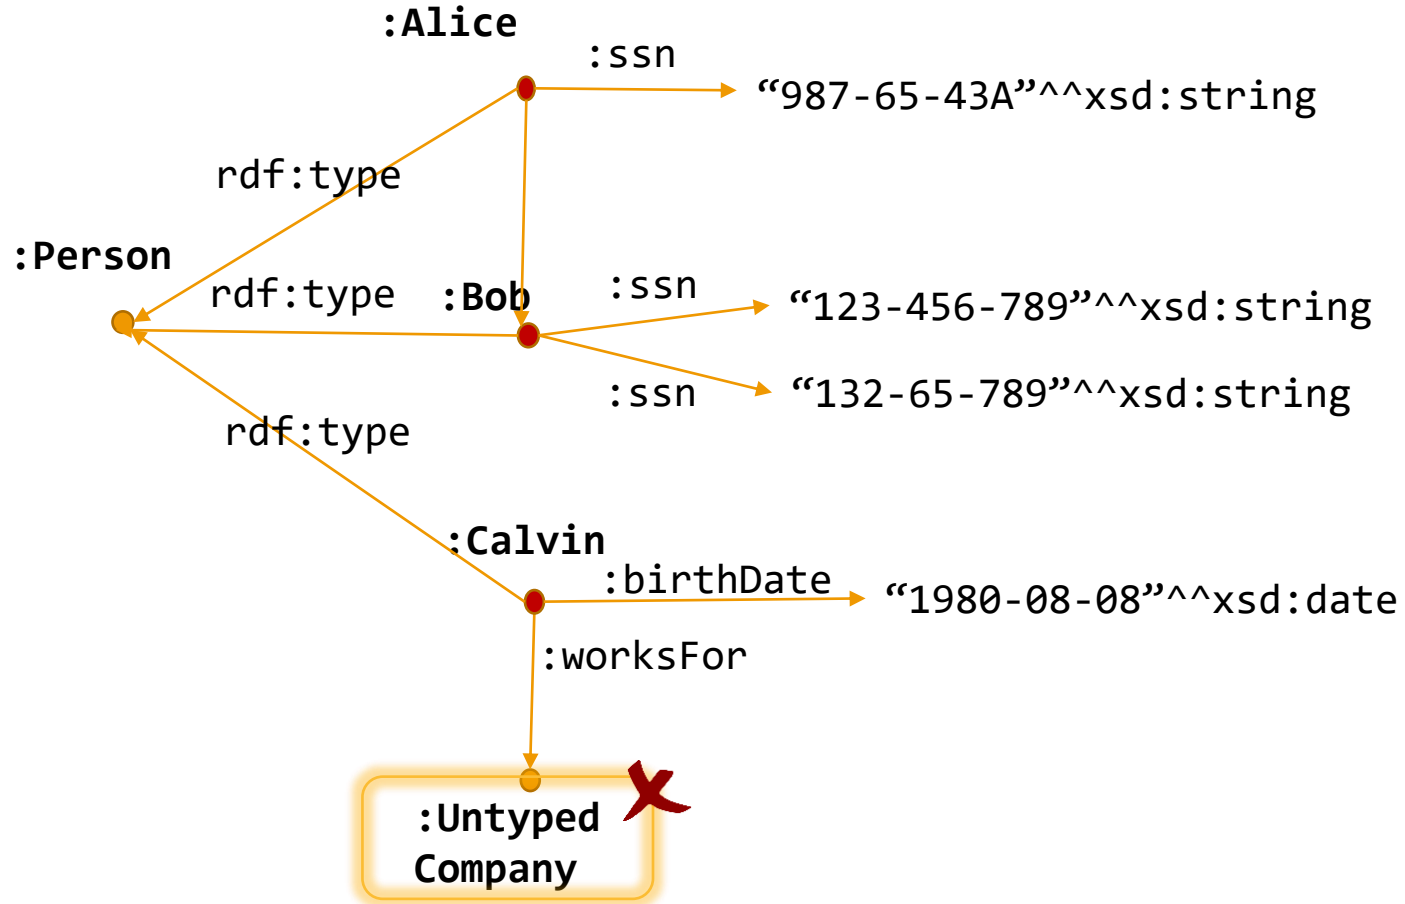

Example – Focus nodes

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\d{3}-\d{2}-\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

Example – Focus nodes

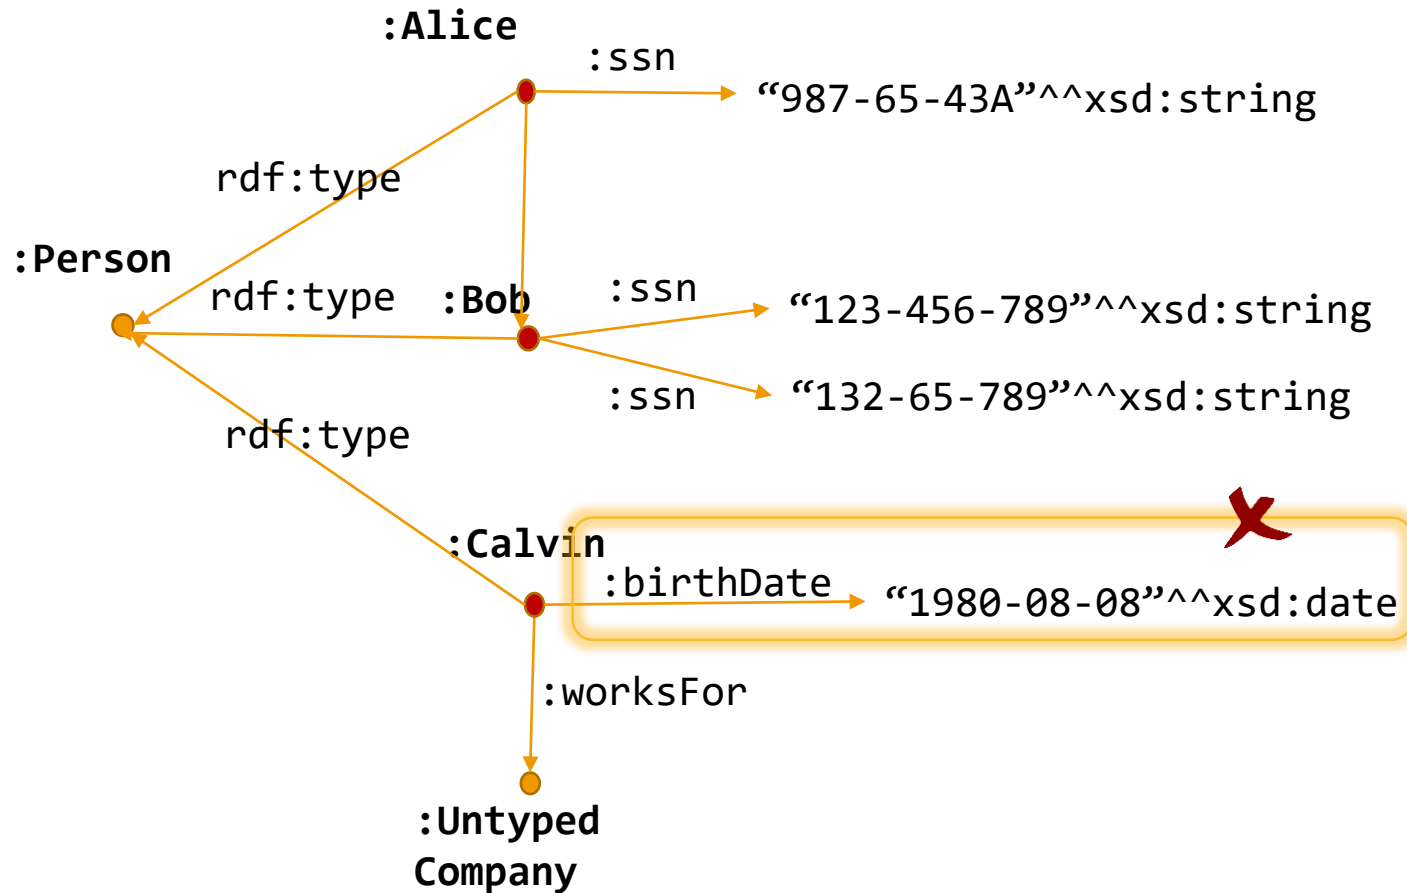

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

The "rdf:type sh:Company" for ex:UntypedCompany is missing

Example – Focus nodes

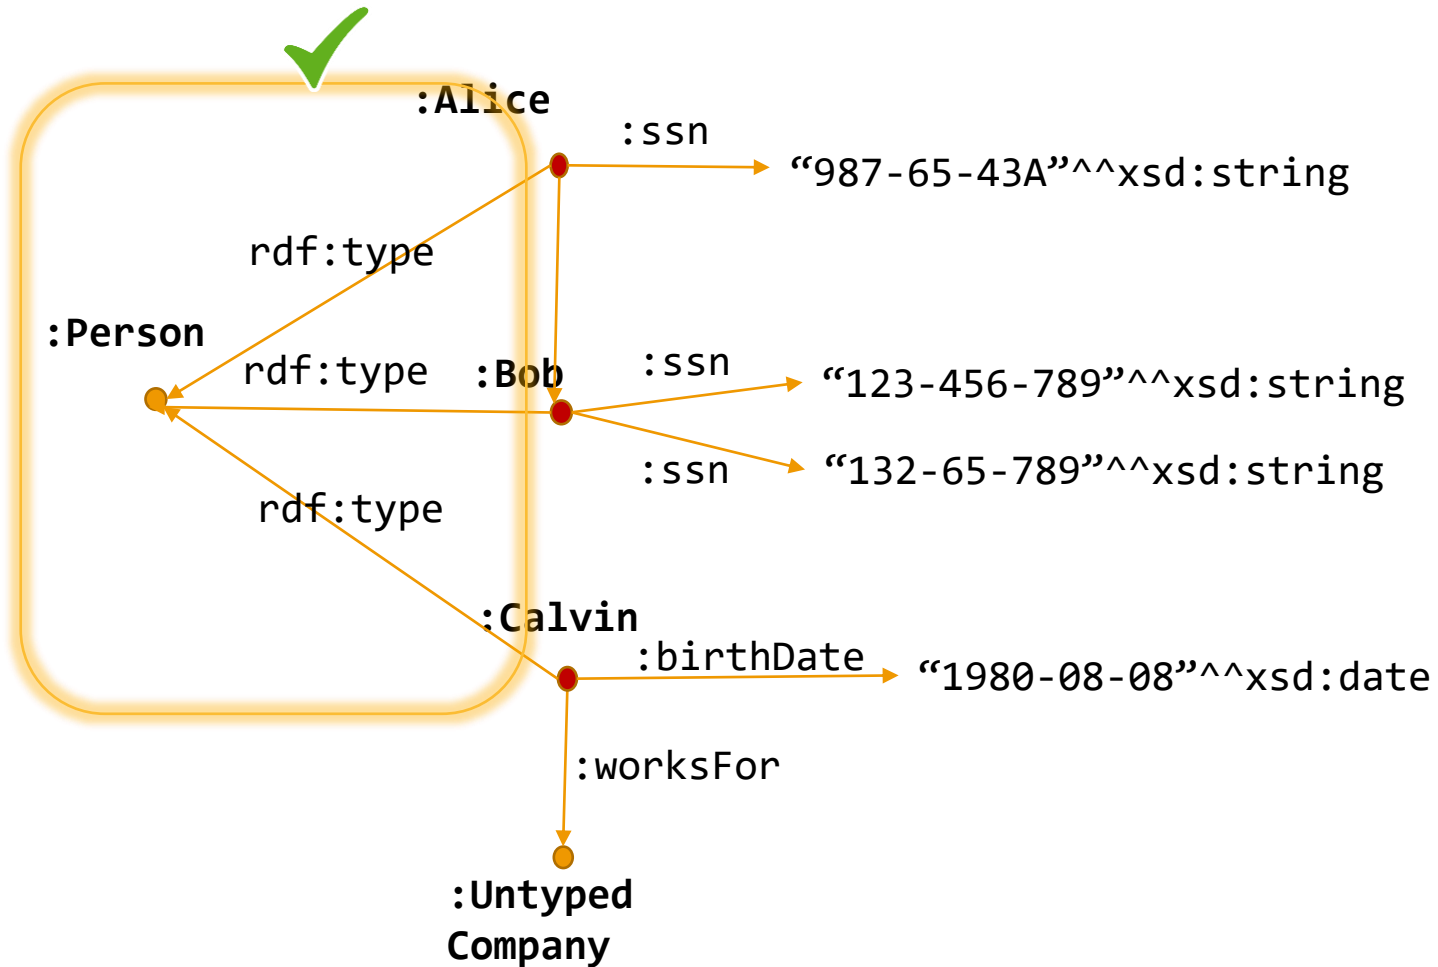

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

Each focus node has values **only** for those properties that have been **explicitly enumerated via the property shapes** specified for the shape via `sh:property`.

Example – Focus nodes

Example shapes graph

```
ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:ssn ;
    sh:maxCount 1 ;
    sh:datatype xsd:string ;
    sh:pattern "^\\d{3}-\\d{2}-\\d{4}$" ;
  ] ;
  sh:property [
    sh:path ex:worksFor ;
    sh:class ex:Company ;
    sh:nodeKind sh:IRI ;
  ] ;
  sh:closed true ;
  sh:ignoredProperties ( rdf:type ) .
```

...**except for** the properties in `sh:ignoredProperties`, i.e. except for `rdf:type`!

```

[ a sh:ValidationReport ;
  sh:conforms false ;
  sh:result
  [ a sh:ValidationResult ;
    sh:resultSeverity sh:Violation ;
    sh:focusNode ex:Alice ;
    sh:resultPath ex:ssn ;
    sh:value "987-65-432A" ;
    sh:sourceConstraintComponent sh:RegexConstraintComponent ;
    sh:sourceShape ... blank node _:b1 on ex:ssn above ... ;
  ] ,
  [ a sh:ValidationResult ;
    sh:resultSeverity sh:Violation ;
    sh:focusNode ex:Bob ;
    sh:resultPath ex:ssn ;
    sh:sourceConstraintComponent sh:MaxCountConstraintComponent ;
    sh:sourceShape ... blank node _:b1 on ex:ssn above ... ;
  ] ,
  [ a sh:ValidationResult ;
    sh:resultSeverity sh:Violation ;
    sh:focusNode ex:Calvin ;
    sh:resultPath ex:worksFor ;
    sh:value ex:UntypedCompany ;
    sh:sourceConstraintComponent sh:ClassConstraintComponent ;
    sh:sourceShape ... blank node _:b2 on ex:worksFor above ... ;
  ] ,
  [ a sh:ValidationResult ;
    sh:resultSeverity sh:Violation ;
    sh:focusNode ex:Calvin ;
    sh:resultPath ex:birthDate ;
    sh:value "1971-07-07"^^xsd:date ;
    sh:sourceConstraintComponent sh:ClosedConstraintComponent ;
    sh:sourceShape sh:PersonShape ;
  ]
]

```

If sh:resultSeverity is not declared in the shape, then the default severity is sh:Violation

Different from $^{\backslash}\backslash\text{d}\{3\}-\backslash\backslash\text{d}\{2\}-\backslash\backslash\text{d}\{4\}\$$

More than one values for ex:ssn

The "rdf:type sh:Company" for ex:UntypedCompany is missing

The predicate ex:birthDate is different from the allowed predicates and the ignored predicates.

Shapes

- **Shape**: A conjunction of constraints that a **target** must satisfy. A target can be:
 - Class (sh:targetClass)
 - Node (sh:targetNode)
 - Objects of a property (sh:targetObject)
 - Subjects of a property (sh:targetSubject)

All instances of the target class

```
:MyShape a sh:NodeShape;  
sh:targetClass :Person;
```

Shapes

- **Shape**: A conjunction of constraints that a **target** must satisfy. A target can be :
 - Class (sh:targetClass)
 - Node (sh:targetNode)
 - Objects of a property (sh:targetObject)
 - Subjects of a property (sh:targetSubject)

Only to specific instances

```
:MyShape a sh:NodeShape;  
sh:targetNode :alice, :bob;
```

Shapes

- **Shape:** A conjunction of constraints that targets nodes that satisfy. A target can be :

- Class (sh:targetClass)
- Node (sh:targetNode)
- Objects of a property (sh:targetObjectsOf)
- Subjects of a property (sh:targetSubjectsOf)

```
:MyShape a sh:NodeShape;  
  sh:targetObjectsOf :ssn;
```

Shapes

- **Shape:** A conjunction of constraints satisfy. A target can be :

- Class (sh:targetClass)
- Node (sh:targetNode)
- Objects of a property (sh:targetObjectsOf)
- Subjects of a property (sh:targetSubjectsOf)

```
:MyShape a sh:NodeShape;  
  sh: targetSubjectsOf :ssn;
```

Node Shape

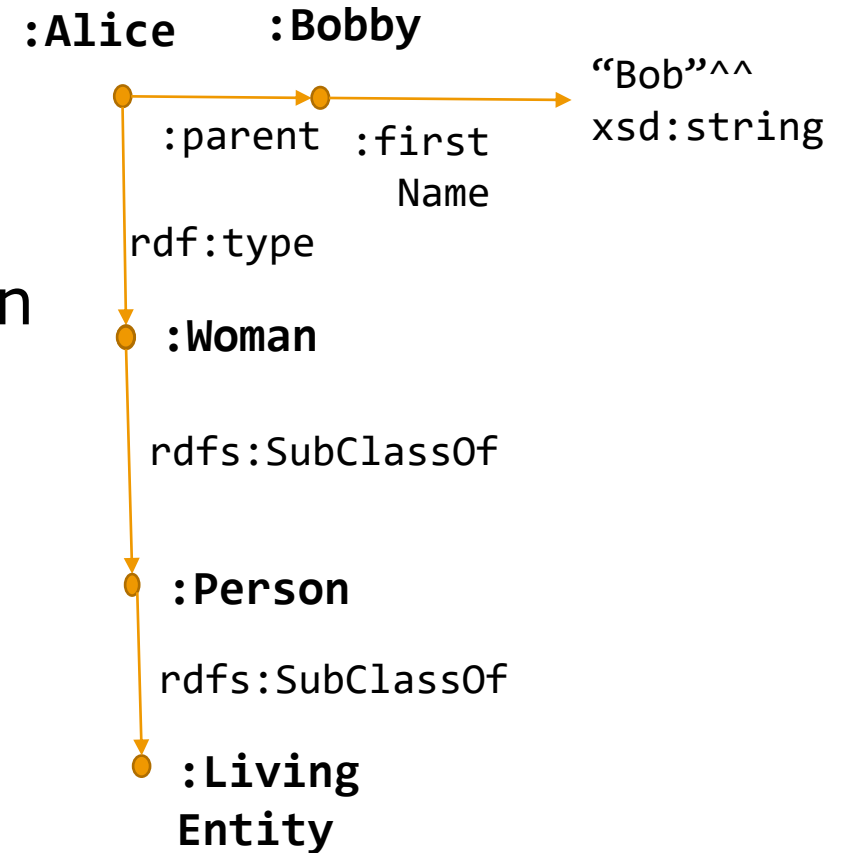

- **Node Shape:** constraints directly on a node (e.g. Customer must be an IRI)
 - e.g., `sh:not`, `sh:closed`, `sh:or`, `sh:property`

Example shapes graph

```
ex:OrConstraintExampleShape
  a sh:NodeShape ;
  sh:targetNode ex:Bob ;
  sh:or (
    [
      sh:path ex:firstName ;
      sh:minCount 1 ;
    ]
    [
      sh:path ex:givenName ;
      sh:minCount 1 ;
    ]
  ) .
```

Property Shape

- **Property Shape:** constraints on the property that is connected to the node via a path (e.g. every Customer *must* have an ID). The path can be:
 - A predicate (ex:parent)
 - Sequence of paths ((ex:parent ex:firstName))
 - Inverse of a path ([sh:inversePath ex:parent])
 - (rdf:type [sh: zeroOrMorePath rdfs:SubClassOf])
 - [sh:alternativePath (ex:father ex:mother)]

Property shape's properties

- Constraint parameters:
 - `sh:minCount`, `sh:maxCount`,
`sh:class`,
`sh:datatype`, `sh:disjoint`,
`sh>equals`, **`sh:node`**

The node shape that all value nodes need to conform to.

Example shapes graph

```
ex:AddressShape
  a sh:NodeShape ;
  sh:property [
    sh:path ex:postalCode ;
    sh:datatype xsd:string ;
    sh:maxCount 1 ;
  ] .

ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [ # _:b1
    sh:path ex:address ;
    sh:minCount 1 ;
    sh:node ex:AddressShape ;
  ] .
```

Property shape's properties

- Constraint parameters:
 - sh:minCount, sh:maxCount, sh:class, sh:datatype, sh:disjoint, sh>equals, sh:node, sh:qualifiedValueShape, sh:QualifiedMinCount, sh:QualifiedMaxCount, etc

The node shape that all value nodes need to conform to.

```
ex:QualifiedValueShapeExampleShape
  a sh:NodeShape ;
  sh:targetNode ex:QualifiedValueShapeExampleValidResource ;
  sh:property [
    sh:path ex:parent ;
    sh:minCount 2 ;
    sh:maxCount 2 ;
    sh:qualifiedValueShape [
      sh:path ex:gender ;
      sh:hasValue ex:female ;
    ] ;
    sh:qualifiedMinCount 1 ;
  ] .
```

Shapes' properties

- We can exclude shapes that do not apply to a specific case (`sh:deactivate`)
- We can present messages to the users (`sh:message`)
- We can declare the severity of the violation (`sh:Info`, `sh:Warning`, `sh:Violation`)

Syntax OWL vs SHACL

```
ex:Person
  a owl:Class ;
  rdfs:subClassOf [
    a owl:Restriction ;
    owl:onProperty ex:hasFather ;
    owl:maxCardinality 1 ;
  ] ;
  rdfs:subClassOf [
    a owl:Restriction ;
    owl:onProperty ex:hasFather ;
    owl:allValuesFrom ex:Person ;
  ] .
```

```
ex:Person
  a owl:Class, sh:NodeShape ;
  sh:property [
    sh:path ex:hasFather ;
    sh:maxCount 1 ;
    sh:class ex:Person ;
  ] .
```

OR

```
ex:Person
  a owl:Class .

ex:PersonShape
  a sh:NodeShape ;
  sh:targetClass ex:Person ;
  sh:property [
    sh:path ex:hasFather ;
    sh:maxCount 1 ;
    sh:class ex:Person ;
  ] .
```

We can
reuse it now

Syntax OWL vs SHACL

- Not always straightforward though

```
schema:Person
  a owl:Class, sh:NodeShape ;
  sh:property [
    sh:path schema:address ;
    sh:or (
      [ sh:class schema:PostalAddress ]
      [ sh:datatype xsd:string ]
    )
  ] .
```

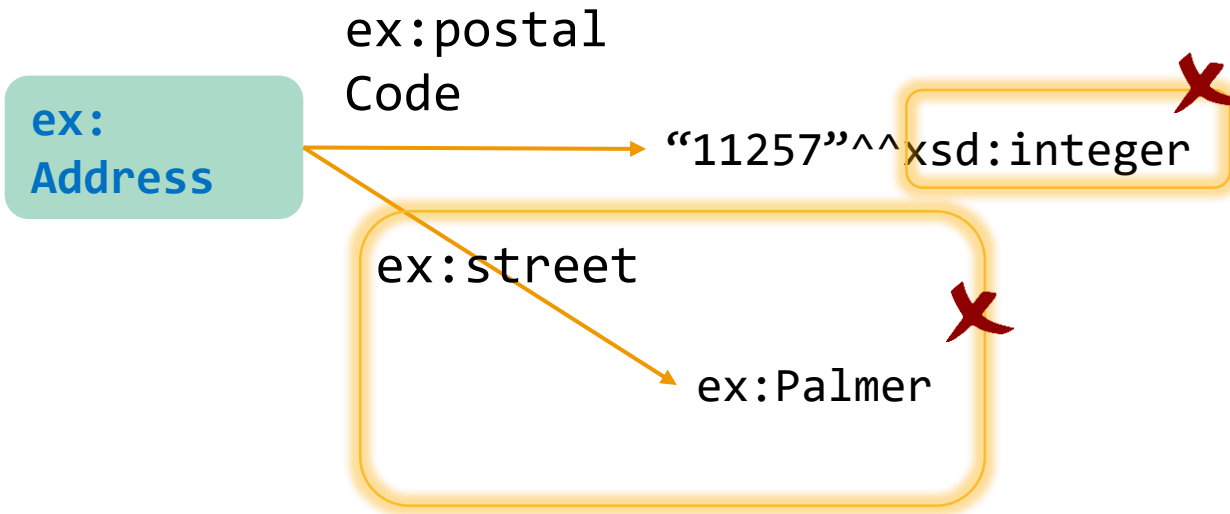

EXERCISE

```
sh:AddressShape a sh:NodeShape;  
  sh:targetClass ex:Address [  
    sh:property ex:postalCode;  
    sh:maxCount 1;  
    sh:datatype xsd:string;  
  ]  
  sh:closed true.
```

Indicate the violations (if any).

EXERCISE

```
sh:AddressShape a sh:NodeShape;  
  sh:targetClass ex:Address [  
    sh:property ex:postalCode;  
    sh:maxCount 1;  
    sh:datatype xsd:string;  
  ];  
  sh:closed true .
```
