

## Binary POSIX Mutexes

- ▶ When threads **share common structures (resources)**, the POSIX library offers a simplified version of semaphores termed binary semaphores or mutexes.
- ▶ A binary semaphore can find itself in only two states: *locked* or *unlocked*.

- ▶

```
int pthread_mutex_init(pthread_mutex_t *mutex,
                       const pthread_mutexattr_t *mutexattr)
```

initializes the mutex-object pointed to by `mutex` according to the mutex attributes specified in `mutexattr`.

- ▶ A mutex may be initialized **only once** by setting its value by the macro `PTHREAD_MUTEX_INITIALIZER`

```
static pthread_mutex_t mymutex =
    PTHREAD_MUTEX_INITIALIZER;
```

- ▶ `pthread_mutex_init` always returns 0

## Locking mutexes

- ▶ Locking a mutex is carried out by:

```
int pthread_mutex_lock(pthread_mutex_t *mutex)
```

- ▶ If the mutex is **currently unlocked**, it becomes locked and owned by the calling thread, and `pthread_mutex_lock` returns immediately.
- ▶ If successful, `pthread_mutex_lock` returns 0.
- ▶ If the mutex is **already locked** by another thread, `pthread_mutex_lock` *blocks* (or “suspends” for the user) the calling thread until the mutex is unlocked.

## Unlocking and Destroying mutexes

### Unlocking a mutex

- ▶ `int pthread_mutex_unlock(pthread_mutex_t *mutex)`
- ▶ If the mutex has been locked and owned by the calling thread, the mutex gets unlocked.
- ▶ Upon successful call, it returns 0.

### Destroying a Mutex

- ▶ `int pthread_mutex_destroy(pthread_mutex_t *mutex)`
- ▶ Destroys the mutex, freeing resources it might hold.
- ▶ In the `LINUXTHREADS` implementation, the call does nothing except checking that mutex is unlocked.
- ▶ Upon successful call, it returns 0.

## Trying to obtain an lock

Trying to get a lock:

- ▶ `int pthread_mutex_trylock(pthread_mutex_t *mutex)`
- ▶ behaves identically to `pthread_mutex_lock`, except that it does not block the calling thread if the mutex is already locked by another thread.
- ▶ Instead, `pthread_mutex_trylock` returns **immediately** with the error code `EBUSY`.
- ▶ If `pthread_mutex_trylock` returns the code `EINVAL`, the mutex was not initialized properly.

## Addressing the problem

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <ctype.h>
int total_words;
pthread_mutex_t counter_lock = PTHREAD_MUTEX_INITIALIZER;

int main(int ac, char *av[])
{
    pthread_t t1, t2;
    void *count_words(void *);
    if ( ac != 3 ) {
        printf("usage: %s file1 file2 \n", av[0]);
        exit(1); }
    total_words=0;
    pthread_create(&t1, NULL, count_words, (void *)av[1]);
    pthread_create(&t2, NULL, count_words, (void *)av[2]);
    pthread_join(t1, NULL);
    pthread_join(t2, NULL);
    printf("Main thread with ID %ld reporting %5d total words\n",
          pthread_self(),total_words);
}
```

## Addressing the problem

```
void *count_words(void *f)
{
    char *filename = (char *)f;
    FILE *fp; int c, prevc = '\0';

    if ( (fp=fopen(filename,"r")) != NULL ){
        while ( ( c = getc(fp) )!= EOF ){
            if ( !isalnum(c) && isalnum(prevc) ){
                pthread_mutex_lock(&counter_lock);
                total_words++;
                pthread_mutex_unlock(&counter_lock);
            }
            prevc = c;
        }
        fclose(fp);
    } else perror(filename);
    return NULL;
}
```

# Outcome (correct!)

```
antoulas@sazerac:~/src$  
antoulas@sazerac:~/src$ wc fileA fileB  
  232  11136  64728 fileA  
   986   9421  54559 fileB  
  1218  20557 119287 total  
antoulas@sazerac:~/src$  
antoulas@sazerac:~/src$ ./twordcount2 fileA fileB  
Main thread wirth ID 140277266184000 reporting 20557 total words  
antoulas@sazerac:~/src$  
antoulas@sazerac:~/src$ ./twordcount2 fileA fileB  
Main thread wirth ID 140158499264320 reporting 20557 total words  
antoulas@sazerac:~/src$
```

## Another Way to Accomplish the Same Correct Operation

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <ctype.h>
#define EXIT_FAILURE 1
void *count_words(void *);
struct arg_set{
    char *fname;
    int count;
};

int main(int ac, char *av[]) {
    pthread_t t1, t2;
    struct arg_set args1, args2;
    if ( ac != 3 ) {
        printf("usage: %s file1 file2 \n", av[0]); exit (EXIT_FAILURE); }

    args1.fname = av[1]; args1.count = 0;
    pthread_create(&t1, NULL, count_words, (void *) &args1);
    args2.fname = av[2]; args2.count = 0;
    pthread_create(&t2, NULL, count_words, (void *) &args2);

    pthread_join(t1, NULL); pthread_join(t2, NULL);

    printf("In file  %-10s there are %5d words\n", av[1], args1.count);
    printf("In file  %-10s there are %5d words\n", av[2], args2.count);
    printf("Main thread %ld reporting %5d total words\n",
           pthread_self(), args1.count+args2.count);
}
```

## Another Way to Accomplish the Same Correct Operation

```
void *count_words(void *a) {
    struct arg_set *args = a;
    FILE *fp; int c, prevc = '\0';
    printf("Working within Thread with ID %ld and counting\n",pthread_self());

    if ( (fp=fopen(args->fname,"r")) != NULL ){
        while ( ( c = getc(fp) )!= EOF ){
            if ( !isalnum(c) && isalnum(prevc) ){
                args->count++;
            }
            prevc = c;
        }
        fclose(fp);
    } else perror(args->fname);
    return NULL;
}
```

⇒ No mutex is used in the above function!

```

## Things to Remember:

- ▶ `pthread_mutex_trylock` returns `EBUSY` if the mutex is already locked by another thread.
- ▶ Every mutex has to be initialized **only once**.
- ▶ `pthread_mutex_unlock` should be called **only** by the thread holding the mutex.
- ▶ **NEVER** have `pthread_mutex_lock` called by the thread that has **already locked** the mutex. A **deadlock** will occur.
- ▶ Should you have `EINVAL` while trying to obtain a lock on a mutex, then the respective initialization has not occurred properly.
- ▶ **NEVER** call `pthread_mutex_destroy` on a locked mutex (`EBUSY`)

## Using pthread\_mutex\_init, pthread\_mutex\_lock, pthread\_mutex\_unlock, pthread\_mutex\_destroy

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include <pthread.h> /* For threads */
#define perror2(s, e) fprintf(stderr, "%s: %s\n", s, strerror(e))
pthread_mutex_t mtx;      /* Mutex for synchronization */
char buf[25];            /* Message to communicate */
void *thread_f(void *);  /* Forward declaration */

main() {
    pthread_t thr;
    int err;
    printf("Main Thread %ld running \n",pthread_self());
    pthread_mutex_init(&mtx, NULL);

    if (err = pthread_mutex_lock(&mtx)) { /* Lock mutex */
        perror2("pthread_mutex_lock", err); exit(1); }
    printf("Thread %ld: Locked the mutex\n", pthread_self());

    if (err = pthread_create(&thr, NULL, thread_f, NULL)) { /* New thread */
        perror2("pthread_create", err); exit(1); }
    printf("Thread %ld: Created thread %ld\n", pthread_self(), thr);

    strcpy(buf, "This is a test message");
    printf("Thread %ld: Wrote message \"%s\" for thread %ld\n",
           pthread_self(), buf, thr);
```

## Using `pthread_mutex_init`, `pthread_mutex_lock`, `pthread_mutex_unlock`, `pthread_mutex_destroy`

```
if (err = pthread_mutex_unlock(&mtx)) { /* Unlock mutex */
    perror2("pthread_mutex_unlock", err); exit(1);
}
printf("Thread %ld: Unlocked the mutex\n", pthread_self());

if (err = pthread_join(thr, NULL)) { /* Wait for thread */
    perror2("pthread_join", err); exit(1); } /* termination */

printf("Exiting Threads %ld and %ld \n", pthread_self(), thr);

if (err = pthread_mutex_destroy(&mtx)) { /* Destroy mutex */
    perror2("pthread_mutex_destroy", err); exit(1); }
pthread_exit(NULL);
}
```

## Using `pthread_mutex_init`, `pthread_mutex_lock`, `pthread_mutex_unlock`, `pthread_mutex_destroy`

```
void *thread_f(void *argp){ /* Thread function */
    int err;
    printf("Thread %ld: Just started\n", pthread_self());
    printf("Thread %ld: Trying to lock the mutex\n", pthread_self());

    if (err = pthread_mutex_lock(&mtx)) { /* Lock mutex */
        perror2("pthread_mutex_lock", err); exit(1); }

    printf("Thread %ld: Locked the mutex\n", pthread_self());
    printf("Thread %ld: Read message \"%s\"\n", pthread_self(), buf);

    if (err = pthread_mutex_unlock(&mtx)) { /* Unlock mutex */
        perror2("pthread_mutex_unlock", err); exit(1); }
    printf("Thread %ld: Unlocked the mutex\n", pthread_self());

    pthread_exit(NULL);
}
```

## Running the multi-threaded program

```
antoulas@sazerac:~/src$
antoulas@sazerac:~/src$ ./sync_by_mutex

## Running the program

```
antoulas@sazerac:~/src$  
antoulas@sazerac:~/src$ ./sum_of_squares 12345678 99 0  
Without mutex  
99 threads: sum of squares up to 12345678 is 5.892573212e+19  
Single thread: sum of squares up to 12345678 is 6.272253963e+20  
Formula based: sum of squares up to 12345678 is 6.272253963e+20  
antoulas@sazerac:~/src$  
antoulas@sazerac:~/src$ ./sum_of_squares 12345678 99 1  
With mutex  
99 threads: sum of squares up to 12345678 is 6.272253963e+20  
Single thread: sum of squares up to 12345678 is 6.272253963e+20  
Formula based: sum of squares up to 12345678 is 6.272253963e+20  
antoulas@sazerac:~/src$
```

- ⦿ Observe the **discrepancy** in the result when no mutex is used.

## Condition Variables

- ▶ A condition (or “condition variable”) is a synchronization means that allows POSIX threads to **suspend execution** and relinquish the processors **until some predicate on the shared data is satisfied**.
- ▶ The basic operations on conditions are:
  - ▶ **signal** the condition (when the predicate becomes true), and **wait** for the condition, suspending the thread in execution
  - ▶ The waiting lasts until another thread signals (or notifies) the condition.
- ▶ A condition variable **must always be associated with a mutex** to avoid a race condition:
  - This race may occur when a thread prepares to wait on a condition variable and another thread signals the condition **just before** the first thread actually waits on the condition variable.

## Initializing a Condition Variable (dynamically)

- ▶ 

```
int pthread_cond_init(pthread_cond_t *cond,  
pthread_condattr_t *cond_attr)
```
- ▶ initializes the condition variable `cond`, using the condition attributes specified in `cond_attr`, or default attributes of `cond_attr` is simply `NULL`.
- ▶ The call always returns 0 upon completion.
- ▶ The `LINUXTHREADS` implementation supports no attributes for conditions (`cond_attr` is ignored).
- ▶ Variables of type `pthread_cond_t` can also be **initialized statically**, using the constant `PTHREAD_COND_INITIALIZER`.

## Waiting on a condition

- ▶ 

```
int pthread_cond_wait(pthread_cond_t *cond,  
                      pthread_mutex_t *mutex);
```
- ▶ **atomically unlocks** the mutex and waits for the condition variable `cond` to be signaled.
- ▶ The call always returns 0.
- ▶ The thread execution is suspended and does not consume any CPU time until the condition variable is signaled (with the help of a `pthread_cond_signal`).
- ▶ Before returning to the calling thread, `pthread_cond_wait` **re-acquires** mutex.
- ▶ The signaling thread must acquire the mutex before the `pthread_cond_signal` call and unlock it immediately after the call.

## Signaling variables

⇒ **Signaling** a variable:

- ▶ `int pthread_cond_signal(pthread_cond_t *cond)}`
- ▶ restarts one of the threads that are waiting on the condition variable `cond`.
- ▶ If no threads are waiting on `cond`, nothing happens.
- ▶ If several threads are waiting on `cond`, **exactly one** is restarted.
- ▶ The call always returns 0.

## Broadcasting to variables

⇒ **Broadcasting** to a condition variable:

- ▶ `int pthread_cond_broadcast(pthread_cond_t *cond)`
- ▶ restarts all the threads that are waiting on the condition variable `cond`.
- ▶ Nothing happens if no threads are waiting on `cond`.
- ▶ The call always returns 0.

## Destroying condition variables

- ▶ `int pthread_cond_destroy(pthread_cond_t *cond)`
- ▶ destroys a condition variable `cond`, freeing the resources it might hold.
- ▶ No threads must be waiting on the condition variable on entrance to `pthread_cond_destroy`.
- ▶ In the `LINUXTHREADS`, the call does nothing except checking that the condition has no waiting threads.
- ▶ Upon successful return the call returns 0.
- ▶ In case some threads are waiting on `cond`, `pthread_cond_destroy` returns `EBUSY`.

## While working with conditions keep in mind:

- ▶ For every condition, use a single distinctly-associated with the condition, `mutex`
- ▶ Get the `mutex`, before checking of any condition.
- ▶ Always use the same `mutex` when changing variables of a condition.
- ▶ Keep a `mutex` for the shortest possible time.
- ▶ Do not forget to release locks at the end with `pthread_mutex_unlock`.

## Using system calls on condition variables

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include <pthread.h>
#define perror2(s, e) fprintf(stderr, "%s: %s\n", s, strerror(e))

pthread_mutex_t mtx = PTHREAD_MUTEX_INITIALIZER;

pthread_cond_t cvar;          /* Condition variable */
char buf[25];                /* Message to communicate */
void *thread_f(void *);      /* Forward declaration */

main(){
    pthread_t thr; int err;
    pthread_cond_init(&cvar, NULL); /* Initialize condition variable */

    if (err = pthread_mutex_lock(&mtx)) { /* Lock mutex */
        perror2("pthread_mutex_lock", err); exit(1); }
    printf("Thread %ld: Locked the mutex\n", pthread_self());

    if (err = pthread_create(&thr, NULL, thread_f, NULL)) { /* New thread */
        perror2("pthread_create", err); exit(1); }
    printf("Thread %ld: Created thread %ld\n", pthread_self(), thr);

    printf("Thread %ld: Waiting for signal\n", pthread_self());

    pthread_cond_wait(&cvar, &mtx); /* Wait for signal */
    printf("Thread %ld: Woke up\n", pthread_self());
    printf("Thread %ld: Read message \"%s\"\n", pthread_self(), buf);
```

## Using system calls on condition variables

```
if (err = pthread_mutex_unlock(&mtx)) { /* Unlock mutex */
    perror2("pthread_mutex_unlock", err); exit(1); }
printf("Thread %ld: Unlocked the mutex\n", pthread_self());

if (err = pthread_join(thr, NULL)) { /* Wait for thread */
    perror2("pthread_join", err); exit(1); } /* termination */
printf("Thread %ld: Thread %ld exited\n", pthread_self(), thr);

if (err = pthread_cond_destroy(&cvar)) {
    /* Destroy condition variable */
    perror2("pthread_cond_destroy", err); exit(1); }
pthread_exit(NULL);
}
```

## Using system calls on condition variables

```
void *thread_f(void *argp){ /* Thread function */
    int err;

    printf("Thread %ld: Just started\n", pthread_self());
    printf("Thread %ld: Trying to lock the mutex\n", pthread_self());

    if (err = pthread_mutex_lock(&mtx)) { /* Lock mutex */
        perror2("pthread_mutex_lock", err); exit(1); }
    printf("Thread %ld: Locked the mutex\n", pthread_self());

    strcpy(buf, "This is a test message");

    printf("Thread %ld: Wrote message \"%s\"\n", pthread_self(), buf);
    pthread_cond_signal(&cvar); /* Awake other thread */
    printf("Thread %ld: Sent signal\n", pthread_self());

    if (err = pthread_mutex_unlock(&mtx)) { /* Unlock mutex */
        perror2("pthread_mutex_unlock", err); exit(1); }
    printf("Thread %ld: Unlocked the mutex\n", pthread_self());

    pthread_exit(NULL);
}
```

## Using system calls on condition variables

```
antoulas@sazerac:~/src$

## The Producer–Consumer Synchronization Problem

- ▶ There is one producer and one consumer.
- ▶ The producer may produce upto a *maximum* number of goods.
- ▶ An item cannot be consumed if the producer has not successfully completed its placement on the buffer.
- ▶ If no items exist on the buffer, the consumer has to wait.
- ▶ if the buffer is full, the producer has to wait.

## A solution for the “bounded buffer” problem

```
#include <stdio.h> // from www.mario-konrad.ch
#include <pthread.h>
#include <unistd.h>

#define POOL_SIZE 6

typedef struct {
    int data[POOL_SIZE];
    int start;
    int end;
    int count;
} pool_t;

int num_of_items = 15;

pthread_mutex_t mtx;
pthread_cond_t cond_nonempty;
pthread_cond_t cond_nonfull;
pool_t pool;

void initialize(pool_t * pool) {
    pool->start = 0;
    pool->end = -1;
    pool->count = 0;
}
```

```
void place(pool_t * pool, int data) {
    pthread_mutex_lock(&mtx);
    while (pool->count >= POOL_SIZE) {
        printf(">> Found Buffer Full \n");
        pthread_cond_wait(&cond_nonfull, &mtx);
    }
    pool->end = (pool->end + 1) % POOL_SIZE;
    pool->data[pool->end] = data;
    pool->count++;
    pthread_mutex_unlock(&mtx);
}

int obtain(pool_t * pool) {
    int data = 0;
    pthread_mutex_lock(&mtx);
    while (pool->count <= 0) {
        printf(">> Found Buffer Empty \n");
        pthread_cond_wait(&cond_nonempty, &mtx);
    }
    data = pool->data[pool->start];
    pool->start = (pool->start + 1) % POOL_SIZE;
    pool->count--;
    pthread_mutex_unlock(&mtx);
    return data;
}
```

```
void * producer(void * ptr)
{
    while (num_of_items > 0) {
        place(&pool, num_of_items);
        printf("producer: %d\n", num_of_items);
        num_of_items--;
        pthread_cond_signal(&cond_nonempty);
        usleep(0);
    }
    pthread_exit(0);
}

void * consumer(void * ptr)
{
    while (num_of_items > 0 || pool.count > 0) {
        printf("consumer: %d\n", obtain(&pool));
        pthread_cond_signal(&cond_nonfull);
        usleep(500000);
    }
    pthread_exit(0);
}
```

```
int main(int argc, char ** argv)
{
    pthread_t cons, prod;

    initialize(&pool);
    pthread_mutex_init(&mtx, 0);
    pthread_cond_init(&cond_nonempty, 0);
    pthread_cond_init(&cond_nonfull, 0);
    pthread_create(&cons, 0, consumer, 0);
    pthread_create(&prod, 0, producer, 0);
    pthread_join(prod, 0);
    pthread_join(cons, 0);
    pthread_cond_destroy(&cond_nonempty);
    pthread_cond_destroy(&cond_nonfull);
    pthread_mutex_destroy(&mtx);
    return 0;
}
```

⇒ Outcome:

```
antoulas@sazerac:~/Set007/src$ ./prod-cons
>> Found Buffer Empty
producer: 15
consumer: 15
producer: 14
producer: 13
producer: 12
producer: 11
producer: 10
producer: 9
>> Found Buffer Full
```

```
consumer: 14
producer: 8
>> Found Buffer Full
consumer: 13
producer: 7
>> Found Buffer Full
consumer: 12
producer: 6
>> Found Buffer Full
consumer: 11
producer: 5
>> Found Buffer Full
consumer: 10
producer: 4
>> Found Buffer Full
consumer: 9
producer: 3
>> Found Buffer Full
consumer: 8
producer: 2
>> Found Buffer Full
consumer: 7
producer: 1
consumer: 6
consumer: 5
consumer: 4
consumer: 3
consumer: 2
consumer: 1
antoulas@sazerac:~/Set007/src$
```

# Thread Safety

- **Problem:** a thread may call library functions that are not thread-safe creating spurious outcomes.
  - ▶ A function is “thread-safe,” if multiple threads can simultaneously execute invocations of the same function without *side-effects* (or interferences of any type!).
  - ▶ POSIX specifies that all functions (including all those from the Standard C Library) except those (next slide) are implemented in a thread-safe manner.
  - ▶ Directive: the calls of the table (next slide) *should* thread-safe implementations denoted with the postfix *\_r*.

## System calls not required to be thread-safe

<i>asctime</i>	<i>basename</i>	<i>catgets</i>	<i>crypt</i>	<i>ctime</i>
<i>dbm_clearerr</i>	<i>dbm_close</i>	<i>dbm_delete</i>	<i>dbm_error</i>	<i>dbm_fetch</i>
<i>dbm_firstkey</i>	<i>dbm_nextkey</i>	<i>dbm_open</i>	<i>dbm_store</i>	<i>dirname</i>
<i>derror</i>	<i>drand48</i>	<i>ecvt</i>	<i>encrypt</i>	<i>endgrent</i>
<i>endpwent</i>	<i>endutxent</i>	<i>fcvt</i>	<i>ftw</i>	<i>gcvt</i>
<i>getc_unlocked</i>	<i>getchar_unlocked</i>	<i>getdate</i>	<i>getenv</i>	<i>getgrent</i>
<i>getgrgid</i>	<i>getgrname</i>	<i>gethostbyaddr</i>	<i>gethostbyname</i>	<i>getlogin</i>
<i>getnetbyaddr</i>	<i>getnetbyname</i>	<i>getnetent</i>	<i>getopt</i>	<i>getprotobyname</i>
<i>getprotobyname</i>	<i>getprotoend</i>	<i>getpwent</i>	<i>getopwnam</i>	<i>getpwuid</i>
<i>getservbyname</i>	<i>getservbyport</i>	<i>getservent</i>	<i>getutxent</i>	<i>getutxid</i>
<i>getutxline</i>	<i>gmtime</i>	<i>hcreate</i>	<i>hdestroy</i>	<i>hsearch</i>
<i>inet_ntoa</i>	<i>l64a</i>	<i>lgamma</i>	<i>lgammaf</i>	<i>lgammal</i>
<i>localeconv</i>	<i>localtime</i>	<i>lrand48</i>	<i>mrnd48</i>	<i>nftw</i>
<i>nl_langinfo</i>	<i>ptsname</i>	<i>putc_unlocked</i>	<i>putchar_unlocked</i>	<i>putenv</i>
<i>pututxline</i>	<i>rand</i>	<i>readdir</i>	<i>setenv</i>	<i>setgrent</i>
<i>setkey</i>	<i>setpwent</i>	<i>setuxent</i>	<i>strerror</i>	<i>strtok</i>
<i>ttyname</i>	<i>unsetenv</i>	<i>wcstombs</i>	<i>wctomb</i>	

- ◊ An easy (“dirty”) way to **safely use** the above calls with threads is to invoke them in conjunction with *mutexes* (i.e., in mutually exclusive fashion).
